ACUPUNCTURE: REVIEW AND ANALYSIS OF REPORTS ON CONTROLLED CLINICAL TRIALS

Acknowledgements

The World Health Organization acknowledges its indebtedness to the experts who participated in the WHO Consultation on Acupuncture held in Cervia, Italy in 1996, at which the selection criteria for the data included in this publication were set. Special thanks are due to Dr Zhu-Fan Xie, Honorary Director of the Institute of Integrated Medicines, First Hospital of Beijing Medical University, China, who drafted, revised and updated this report. Further, Dr Xie made numerous Chinese language documents available in English. We also thank Dr Hongguang Dong, Geneva University Hospital, Switzerland for providing additional information.

Appreciation is extended to the Norwegian Royal Ministry of Health and Social Affairs for providing the financial support to print this review.

Introduction

Background

Over its 2500 years of development, a wealth of experience has accumulated in the practice of acupuncture, attesting to the wide range of diseases and conditions that can be effectively treated with this approach. Unlike many other traditional methods of treatment, which tend to be specific to their national or cultural context, acupuncture has been used throughout the world, particularly since the 1970s. In recognition of the increasing worldwide interest in the subject, the World Health Organization (WHO) conducted a symposium on acupuncture in June 1979 in Beijing, China. Physicians practising acupuncture in different countries were invited to identify the conditions that might benefit from this therapy. The participants drew up a list of 43 suitable diseases. However, this list of indications was not based on formal clinical trials conducted in a rigorous scientific manner, and its credibility has been questioned.

The past two decades have seen extensive studies on acupuncture, and great efforts have been made to conduct controlled clinical trials that include the use of "sham" acupuncture or "placebo" acupuncture controls. Although still limited in number because of the difficulties of carrying out such trials, convincing reports, based on sound research methodology, have been published. In addition, experimental investigations on the mechanism of acupuncture have been carried out. This research, while aimed chiefly at answering how acupuncture works, may also provide evidence in support of its effectiveness.

In 1991, a progress report on traditional medicine and modern health care was submitted by the Director-General of WHO to the Forty-fourth World Health Assembly.¹ The report pointed out that in countries where acupuncture forms part of the cultural heritage, its use in an integrated approach to modern and traditional medicine presents no difficulty. However, in countries where modern Western medicine is the foundation of health care, the ethical use of acupuncture requires objective evidence of its efficacy under controlled clinical conditions.

In 1996, a draft report on the clinical practice of acupuncture was reviewed at the WHO Consultation on Acupuncture held in Cervia, Italy. The participants recommended that WHO should revise the report, focusing on data from controlled clinical trials. This publication is the outcome of that process.

¹ *Traditional medicine and modern health care. Progress report by the Director-General.* Geneva, World Health Organization, 1991 (unpublished document A44/10).

Objectives

The objective of this publication is to provide a review and analysis of controlled clinical trials of acupuncture therapy, as reported in the current literature, with a view to strengthening and promoting the appropriate use of acupuncture in health care systems throughout the world. Information on the therapeutic mechanisms of acupuncture has also been incorporated.

Since the methodology of clinical research on acupuncture is still under debate, it is very difficult to evaluate acupuncture practice by any generally accepted measure. This review is limited to controlled clinical trials that were published up to 1998 (and early 1999 for some journals), in the hope that the conclusions will prove more acceptable. Such trials have only been performed for a limited number of diseases or disorders. This should not be taken to mean, however, that acupuncture treatment of diseases or disorders not mentioned here is excluded.

Use of the publication

This publication is intended to facilitate research on and the evaluation and application of acupuncture. It is hoped that it will provide a useful resource for researchers, health care providers, national health authorities and the general public.

It must be emphasized that the list of diseases, symptoms or conditions covered here is based on collected reports of clinical trials, using the descriptions given in those reports. Only national health authorities can determine the diseases, symptoms and conditions for which acupuncture treatment can be recommended.

The data in the reports analysed were not always clearly recorded. We have made every effort to interpret them accurately, in some cases maintaining the original wording in the text and summary table presented here. Research on traditional medicine, including acupuncture is by no means easy. However, researchers should be encouraged to ensure the highest possible standards of study design and reporting in future research in order to improve the evidence base in this field.

Dr Xiaorui Zhang

Acting Coordinator Traditional Medicine (TRM) Department of Essential Drugs and Medicines Policy (EDM) World Health Organization

1. General considerations

1.1 Definition

Acupuncture literally means to puncture with a needle. However, the application of needles is often used in combination with moxibustion—the burning on or over the skin of selected herbs—and may also involve the application of other kinds of stimulation to certain points. In this publication the term "acupuncture" is used in its broad sense to include traditional body needling, moxibustion, electric acupuncture (electro-acupuncture), laser acupuncture (photo-acupuncture), microsystem acupuncture such as ear (auricular), face, hand and scalp acupuncture, and acupressure (the application of pressure at selected sites).

1.2 Need for evaluation

Acupuncture originated in China many centuries ago and soon spread to Japan, the Korean peninsula and elsewhere in Asia. Acupuncture is widely used in health care systems in the countries of this region; it is officially recognized by governments and well received by the general public.

Although acupuncture was introduced to Europe as long ago as the early seventeenth century, scepticism about its effectiveness continues to exist in countries where modern Western medicine is the foundation of health care, especially in those where acupuncture has not yet been widely practised. People question whether acupuncture has a true therapeutic effect, or whether it works merely through the placebo effect, the power of suggestion, or the enthusiasm with which patients wish for a cure. There is therefore a need for scientific studies that evaluate the effectiveness of acupuncture under controlled clinical conditions.

This publication reviews selected studies on controlled clinical trials. Some of these studies have provided incontrovertible scientific evidence that acupuncture is more successful than placebo treatments in certain conditions. For example, the proportion of chronic pain relieved by acupuncture is generally in the range 55–85%, which compares favourably with that of potent drugs (morphine helps in 70% of cases) and far outweighs the placebo effect (30–35%) (1–3). In addition, the mechanisms of acupuncture analgesia have been studied extensively since the late 1970s, revealing the role of neural and humoral factors.

1.3 Evaluation methodology

Unlike the evaluation of a new drug, controlled clinical trials of acupuncture are extremely difficult to conduct, particularly if they have to be blind in design and the acupuncture has to be compared with a placebo. Various "sham" or "placebo" acupuncture procedures have been designed, but they are not easy to perform in countries such as China where acupuncture is widely used. In these countries, most patients know a great deal about acupuncture, including the special sensation that should be felt after insertion or during manipulation of the needle. Moreover, acupuncturists consider these procedures unethical because they are already convinced that acupuncture is effective. In fact, most of the placebo-controlled clinical trials have been undertaken in countries where there is scepticism about acupuncture, as well as considerable interest.

A more practical way to evaluate the therapeutic effect of acupuncture is to compare it with the effect of conventional therapy through randomized controlled trials or group studies, provided that the disease conditions before treatment are comparable across the groups, with outcome studies developed for all patients.

Because of the difficulty of ruling out the placebo effect, a comparative study with no treatment as the control may not be convincing in the evaluation of acupuncture practice. Retrospective surveys, in which the effect of acupuncture therapy is compared with past treatments, may not be of significance either, particularly if they have not been well designed. Non-comparative studies are certainly of little significance, particularly when acupuncture is used for the treatment of a self-limited disease. However, if rapid improvement can be achieved in the treatment of a long-standing, chronic disease, or if there is definite improvement in a disease that is generally recognized as intractable to conventional treatment, the effect of acupuncture should be viewed in a more favourable light, even when a well-designed, controlled study has not been carried out.

Another difficulty in evaluating acupuncture practice is that the therapeutic effect depends greatly on the proficiency of the acupuncturists – their ability and skill in selecting and locating the acupuncture points and in manipulating the needles. This may partly explain the disparities or inconsistencies in the results reported by different authors, even when their studies were carried out on equally sound methodological bases.

Evaluating acupuncture practice and arriving at generally accepted conclusions is no easy task, therefore. While effectiveness is doubtless of the utmost importance, other factors, including safety, cost, availability and the condition of local health services must also be considered. Given the same effectiveness, these other factors may lead to different evaluations of acupuncture in different countries and areas. However, conclusions are needed that apply to worldwide use, particularly for countries and areas where proper development of acupuncture practice would bring a great deal of benefit. Evaluations should not therefore be confined to those diseases for which modern conventional treatments are inadequate or ineffective.

Because of the success of surgical procedures carried out under acupuncture analgesia, the treatment of pain with acupuncture has been extensively studied. For other conditions often treated with acupuncture, there are fewer reports that have adequate methodology.

1.4 Safety

Generally speaking, acupuncture treatment is safe if it is performed properly by a well-trained practitioner. Unlike many drugs, it is non-toxic, and adverse reactions are minimal. This is probably one of the chief reasons why acupuncture is so popular in the treatment of chronic pain in many countries. As mentioned previously, acupuncture is comparable with morphine preparations in its effectiveness against chronic pain, but without the adverse effects of morphine, such as dependency.

Even if the effect of acupuncture therapy is less potent than that of conventional treatments, acupuncture may still be worth considering because of the toxicity or adverse effects of conventional treatments. For example, there are reports of controlled clinical trials showing that acupuncture is effective in the treatment of rheumatoid arthritis (4–6), although not as potent as corticosteroids. Because, unlike corticosteroids, acupuncture treatment, does not cause serious side-effects, it seems reasonable to use acupuncture for treating this condition, despite the difference in effectiveness.

1.5 Availability and practicability

The availability and practicability of acupuncture are also important factors to consider. The advantages of acupuncture are that it is simple, convenient and has few contraindications. Although the success rate of acupuncture therapy in treating kidney stones, for example, is confirmed by comparative studies with other therapies (7), it is by no means as high as that of surgical intervention. However, acupuncture treatment of kidney stones is still worth recommending because of its simplicity, which makes it more acceptable to patients.

There are also instances where acupuncture is not more practicable than conventional therapy. For example, the effectiveness of acupuncture treatment of acute bacillary dysentery has been shown to be comparable with that of furazolidone (8-10), but this is of rather academic significance because oral administration of furazolidone or other antidysenteric drugs is more convenient.

The conditions of the health service in a given country or area should also be considered in evaluating acupuncture practice. In developing countries, where medical personnel and medicines are still lacking, the need for acupuncture may be considerable and urgent; proper use of this simple and economic therapy could benefit a large number of patients. On the other hand, in developed countries, where the health system is well established, with sophisticated technology, adequate personnel and a well-equipped infrastructure, acupuncture might be considered to be of great value in only a limited number of conditions. It could still serve as a valuable alternative treatment for many diseases or conditions for which modern conventional treatments are unsuccessful. It is also valuable in situations where the patient is frightened of the potential risks or adverse effects of modern conventional treatments. In fact, in some developed countries, the diseases for which patients seek help from acupuncturists tend to be beyond the scope of orthodox medicine.

1.6 Studies on therapeutic mechanisms

Clinical evaluations indicate whether the therapy works; research on the mechanisms involved indicates how it works and can also provide important information on efficacy. Knowing that acupuncture is effective and why makes the practitioner confident in its use, and also allows the technique to be used in a more appropriate way.

The clinical evaluation may precede studies on the mechanisms, or vice versa. For acupuncture, in most instances the clinical effect has been tested first. Use of the technique may then be further expanded on the basis of the results of research on the mechanisms. For example, experimental studies of the effect of acupuncture on white blood cells led to a successful trial of the treatment of leukopenia caused by chemotherapy.

To date, modern scientific research studies have revealed the following actions of acupuncture:

- inducing analgesia
- protecting the body against infections
- regulating various physiological functions.

In reality, the first two actions can also be attributed to the regulation of physiological functions. The therapeutic effects of acupuncture are thus brought about through its regulatory actions on various systems, so that it can be regarded as a nonspecific therapy with a broad spectrum of indications, particularly helpful in functional disorders. Although it is often used as a symptomatic treatment (for pain, for instance), in many cases it actually acts on one of the pathogenic links of a disease.

Although different acupuncture points and manipulations may have an effect through different actions, the most important factor that influences the direction of action is the condition of the patient. Numerous examples reveal that the regulatory action of acupuncture is bi-directional. Acupuncture lowers the blood pressure in patients with hypertension and elevates it in patients with hypotension; increases gastric secretion in patients with hypoacidity, and decreases it in patients with hyperacidity; and normalizes intestinal motility under X-ray observation in patients with either spastic colitis or intestinal hypotonia (*11*). Therefore, acupuncture itself seldom makes the condition worse. In most instances, the main danger of its inappropriate application is neglecting the proper conventional treatment.

Since its therapeutic actions are achieved by mobilization of the organism's own potential, acupuncture does not produce adverse effects, as do many drug therapies. For example, when release of hydrocortisone plays an important role in the production of a therapeutic effect, the doses of this substance released by acupuncture are small and finely regulated, thereby avoiding the side-effects of hydrocortisone chemotherapy (12). On the other hand—and for the same reason—acupuncture has limitations. Even under conditions where acupuncture is indicated, it may not work if the mobilization of the individual's potential is not adequate for recovery.

1.7 Selection of clinical trial reports

In recent decades, numerous clinical trials have been reported; however, only formally published articles that meet one of the following criteria are included in this review:

- randomized controlled trials (mostly with sham acupuncture or conventional therapy as control) with an adequate number of patients observed;
- nonrandomized controlled clinical trials (mostly group comparisons) with an adequate number of patients observed and comparable conditions in the various groups prior to treatment.

In many published placebo-controlled trials, sham acupuncture was carried out by needling at incorrect, theoretically irrelevant sites. Such a control really only offers information about the most effective sites of needling, not about the specific effects of acupuncture (13). Positive results from such trials, which revealed that genuine acupuncture is superior to sham acupuncture with statistical significance, provide evidence showing the effectiveness of acupuncture treatment. On the other hand, negative results from such trials, in which both the genuine and sham acupuncture showed considerable therapeutic effects with no significant difference between them, can hardly be taken as evidence negating the effectiveness of acupuncture. In the latter case, especially in treatment of pain, most authors could only draw the conclusion that additional control studies were needed. Therefore, these reports are generally not included in this review.

The reports are first reviewed by groups of conditions for which acupuncture therapy is given (section 2). The clinical conditions covered have then been classified into four categories (section 3):

- 1. Diseases, symptoms or conditions for which acupuncture has been proved through controlled trials to be an effective treatment.
- 2. Diseases, symptoms or conditions for which the therapeutic effect of acupuncture has been shown, but for which further proof is needed.
- 3. Diseases, symptoms or conditions for which there are only individual controlled trials reporting some therapeutic effects, but for which acupuncture is worth trying because treatment by conventional and other therapies is difficult.
- 4. Diseases, symptoms or conditions in which acupuncture may be tried provided the practitioner has special modern medical knowledge and adequate monitoring equipment.

Section 4 provides a tabulated summary of the controlled clinical trials reviewed, giving information on the number of subjects, the study design, the type of acupuncture applied, the controls used and the results obtained.

2. Review of clinical trial reports

2.1 Pain

The effectiveness of acupuncture analgesia has already been established in controlled clinical studies. As mentioned previously, acupuncture analgesia works better than a placebo for most kinds of pain, and its effective rate in the treatment of chronic pain is comparable with that of morphine. In addition, numerous laboratory studies have provided further evidence of the efficacy of acupuncture's analgesic action as well as an explanation of the mechanism involved. In fact, the excellent analgesic effects of acupuncture have stimulated research on pain.

Because of the side-effects of long-term drug therapy for pain and the risks of dependence, acupuncture analgesia can be regarded as the method of choice for treating many chronically painful conditions.

The analgesic effect of acupuncture has also been reported for the relief of eye pain due to subconjunctival injection (14), local pain after extubation in children (15), and pain in thromboangiitis obliterans (16).

2.1.1 Head and face

The use of acupuncture for treating chronic pain of the head and face has been studied extensively. For tension headache, migraine and other kinds of headache due to a variety of causes, acupuncture has performed favourably in trials comparing it with standard therapy, sham acupuncture, or mock transcutaneous electrical nerve stimulation (TENS) (17–27). The results suggest that acupuncture could play a significant role in treating such conditions.

Chronic facial pain, including craniomandibular disorders of muscular origin, also responds well to acupuncture treatments (28-31). The effect of acupuncture is comparable with that of stomatognathic treatments for temporomandibular joint pain and dysfunction. Acupuncture may be useful as complementary therapy for this condition, as the two treatments probably have a different basis of action (2, 32).

2.1.2 Locomotor system

Chronically painful conditions of the locomotor system accompanied by restricted movements of the joints are often treated with acupuncture if surgical intervention is not necessary. Acupuncture not only alleviates pain, it also reduces muscle spasm, thereby increasing mobility. Joint damage often results from muscle malfunction, and many patients complain of arthralgia before any changes are demonstrable by X-ray. In these cases, acupuncture may bring about a permanent cure. Controlled studies on common diseases and conditions in this category have been reported by different authors, with favourable results for acupuncture treatments compared with standard therapy, delayed-treatment controls, control needling, mock TENS, or other sham acupuncture techniques. The conditions concerned include cervical spondylitis or neck pain due to other causes (33–37), periarthritis of the shoulder (38, 39) fibromyalgia (40), fasciitis (41), epicondylitis (tennis elbow) (42–44), low back pain (45–49), sciatica (50–53), osteoarthritis with knee pain (54–56), and radicular and pseudoradicular pain syndromes (57). In some reports, comparison was made between standard care and acupuncture as an adjunct to standard care. The conclusion from one such randomized controlled trial was that acupuncture is an effective and judicious adjunct to conventional care for patients with osteoarthritis of the knee (58).

Rheumatoid arthritis is a systemic disease with extra-articular manifestations in most patients. In this disease, dysfunction of the immune system plays a major role, which explains the extra-articular and articular features. Acupuncture is beneficial in the treatment of rheumatoid arthritis (4–6). While acupuncture may not improve the damage that has been done to the joints, successful pain relief has been verified in the majority of controlled studies (58). The action of acupuncture on inflammation and the dysfunctional immune system is also beneficial (5, 59).

2.1.3 Gout

In a randomized controlled trial, blood-pricking acupuncture was compared with conventional medication (allopurinol). The acupuncture group showed greater improvement than the allopurinol group. In addition, a similar reduction of uric acid levels in the blood and urine of both groups was noted (60). Plum-blossom needling (acupuncture using plum-blossom needles), together with cupping (the application to the skin of cups which are then depressurized), has been recommended for treating gouty arthritis (61).

2.1.4 Biliary and renal colic

Acupuncture is suitable for treating acute pain, provided the relief of pain will not mask the correct diagnosis, for which other treatments may be needed. Biliary and renal colic are two conditions for which acupuncture can be used not only as an analgesic but also as an antispasmodic. In controlled studies on biliary colic (62–64) and renal colic (7, 65, 66), acupuncture appears to have advantages over conventional drug treatments (such as intramuscular injection of atropine, pethidine, anisodamine (a Chinese medicine structurally related to atropine, isolated from *Anisodus tanguticus*), bucinnazine (also known as bucinperazine) or a metamizole–camylofin combination). It provides a better analgesic effect in a shorter time, without side-effects. In addition, acupuncture is effective for relieving abdominal colic, whether it occurs in acute gastroenteritis or is due to gastrointestinal spasm (67).

2.1.5 Traumatic or postoperative pain

For traumas such as sprains, acupuncture is not only useful for relieving pain without the risk of drug dependence, but may also hasten recovery by improving local circulation (68–70). Acupuncture analgesia to relieve postoperative pain is well recognized and has been confirmed in controlled studies (71–76). The first successful operation under acupuncture analgesia was a tonsillectomy. This was, in fact, inspired by the success of acupuncture in relieving post-tonsillectomy pain. Post-tonsillectomy acupuncture was re-evaluated in a controlled study in 1990, which not only showed prompt alleviation of throat pain, but also reduction in salivation and promotion of healing in the operative wound (76).

2.1.6 Dentistry

Acupuncture has been widely used in dentistry. There are reports of randomized controlled trials on the analgesic effect of acupuncture for postoperative pain from various dental procedures, including tooth extraction (77–78), pulp devitalization (79), and acute apical periodontitis (80). According to a systematic review of papers on the use of acupuncture in dentistry published between 1966 and 1996, 11 out of 15 randomized controlled studies with blind controls, appropriate statistics and sufficient follow-up showed standard acupuncture to be more effective than a placebo or sham acupuncture. It was therefore concluded that acupuncture should be considered a reasonable alternative or supplement to current dental practice as an analgesic (81). Its use in the treatment of temporomandibular dysfunction was also supported in these studies.

2.1.7 Childbirth

In childbirth, acupuncture analgesia is useful for relieving labour pain and can significantly reduce the duration of labour (82). In the case of weakened uterine contractions, acupuncture increases the activity of the uterus. Episiotomy and subsequent suturing of the perineum can also be carried out with acupuncture analgesia. In addition, the avoidance of narcotics is advantageous for newborn infants.

2.1.8 Surgery

Acupuncture analgesia has the following advantages in surgical operations. It is a very safe procedure compared with drug anaesthesia; no death has ever been reported from acupuncture analgesia. There is no adverse effect on physiological functions, whereas general anaesthesia often interferes with respiration and blood pressure, for example. There are fewer of the postoperative complications that sometimes occur after general anaesthesia, such as nausea, urinary retention, constipation, and respiratory infections. The patient remains conscious and able to talk with the medical team during the operation so that injury of the facial and recurrent laryngeal nerve can be avoided. However, remaining conscious may be a disadvantage if the patient cannot tolerate the emotional stress of the procedure. While the benefits of acupuncture analgesia are many, the disadvantages must also be considered. The use of acupuncture is more time-consuming and in many cases may fail to bring about complete analgesia. It is often not suitable for abdominal surgery because suppression of visceral pain and muscle relaxation may be inadequate. It is not suitable in children because few children will tolerate the needling and keep still during major surgery. Also, the surgeon must be quick and deft, so that the operation can be finished before the patient develops tolerance to the needling.

In conclusion, acupuncture analgesia as an anaesthetic for surgical procedures is indicated in selected patients who show a good response to needling in the preoperative trial, particularly when they may be a poor surgical risk under conventional general anaesthesia. The use of adjuvant drugs to potentiate the effect of the acupuncture treatment is preferred. Acupuncture can also be used in combination with general anaesthesia to reduce the dosage of anaesthetic agents (*83*).

2.2 Infections

Acupuncture has been reported to be effective for treating acute bacillary dysentery (8-10). Its effect is comparable with that of conventional medicines such as furazolidone, but the use of acupuncture in the first line of defence against this disease is not practicable – daily performance of needling procedures is much more complicated than administering oral drug therapy. However, when no antidysenteric agent is available or the patient is allergic to antidysenteric agents, acupuncture may occasionally be used.

The results of research on the effects of acupuncture treatments that stimulate the immune system suggest that acupuncture may be of use in conjunction with other medical therapies for treating infections (*84*).

The effect of acupuncture on the immune system has been tested in hepatitis B virus carriers. In a comparative study, acupuncture–moxibustion is apparently superior to herbal medications in producing hepatitis B e core antibodies and reducing hepatitis B surface antigen (*85*). For epidemic haemorrhagic fever, compared with steroid and supportive treatments, moxibustion shortened the period of oliguria and promoted the reduction of kidney swelling (*86*).

Acupuncture may be useful in treating pertussis (whooping cough), by relieving cough as well as promoting a cure (87).

2.3 Neurological disorders

In the neurological field, headaches, migraines and neuralgia are the common painful conditions treated with acupuncture. Strokes and their sequelae are another major indication for acupuncture. Early treatment of paresis after stroke has proved highly effective.

Because improvement in the effects of stroke also occurs naturally, there has been some doubt about the contribution of acupuncture. In recent years, however, a number of controlled clinical evaluations have been undertaken in stroke patients. For example, in randomized controlled studies, acupuncture treatment of hemiplegia due to cerebral infarction gave better results than conventional medication (88–93) and physiotherapy (94, 95). There were also beneficial effects when acupuncture was used as a complement to rehabilitation (96–98).

In one study, patients with ischaemic cerebrovascular disease treated with acupuncture were compared with patients treated with conventional drugs. Nerve function, as evaluated by electroencephalographic map and somatosensory evoked potential, showed a much more marked improvement in the patients treated with acupuncture (*89*). This has been further confirmed by experimental studies. In the laboratory, a rat model of reversible middle cerebral artery occlusion was used. The somatosensory evoked potential recorded before and after the occlusion showed that electric acupuncture markedly promoted the recovery of the amplitude of the P1–N1 wave (to 58.6% in the electric acupuncture group in contrast to 25.5% in the control group after 7 days) (*93*). In addition, recent clinical studies suggest that the effectiveness of acupuncture therapy can be further promoted by using temporal acupuncture (*99, 100*).

Comparative studies have shown acupuncture treatments to be as effective for treating hemiplegia due to cerebral haemorrhage as for that due to cerebral infarction. Since early treatment with physiotherapy is unsatisfactory, it is advisable to use acupuncture as the primary treatment. Even in hemiplegia of long duration, remarkable improvements can often be achieved. Hemiplegia due to other causes, such as brain surgery, can also be improved by acupuncture (101). Aphasia caused by acute cerebrovascular disorders can also be treated with acupuncture (102).

Although acupuncture is effective for many painful conditions, there are only a few reports on post-herpetic neuralgia. Two of them were based on randomized clinical trials and provided completely opposite results (*103, 104*). Evaluation of acupuncture in the treatment of this painful condition therefore awaits further study.

Peripheral nervous disorders are often treated with acupuncture. For example, good effects for Bell's palsy have been reported in randomized controlled trials (105, 106). Facial spasm is another peripheral nervous disorder for which acupuncture treatment may be indicated. For this condition it has been shown that wrist-ankle acupuncture is significantly better than traditional body acupuncture (107).

Coma is a serious condition that can hardly be cured by acupuncture alone, but in a comparative study of two groups of patients with similar levels of coma, a significantly greater number of patients in the acupuncture group had a 50% or greater neurological recovery than those in the control group. This suggests that it is reasonable to incorporate acupuncture along with other therapeutic and supportive measures in the treatment of the comatose patient (*108*).

Insomnia can also be treated successfully with acupuncture. In randomized control trials, both auricular acupressure and auricular acupuncture had a hypnotic effect (109, 110).

2.4 Respiratory disorders

Acupuncture is often used in treating respiratory disorders. Allergic rhinitis is one of the major indications. In controlled studies, it has been shown that acupuncture is more effective than antihistamine drugs in the treatment of allergic rhinitis (111–115). Acupuncture's lack of side-effects is a distinct advantage in treating this condition; however, its protective effect against allergen-provoked rhinitis has not been verified (116).

The acute symptoms of tonsillitis can be effectively relieved with acupuncture (*117*). Since there is no information about the incidence of complications secondary to tonsillitis treated with acupuncture, in clinical practice antibiotic therapy should still be considered the treatment of choice for acute tonsillitis. For sore throats from other causes, acupuncture treatment provides definite benefits, in contrast to a placebo and acupuncture refusal (*118*).

Although there are conflicting results from controlled trials in treating bronchial asthma with acupuncture, the majority of the reports suggest that acupuncture is effective (119-123) and that the effect is related to the points used (122). While bronchial asthma is not cured by acupuncture, it may be substantially relieved, at least for short periods of time. The success rates quoted in the literature are 60– 70%. Acupuncture has a limited role in treating acute asthmatic attacks since it is a weak bronchodilator, but it may serve as a prophylactic measure over the long term. Controlled trials have shown that acupuncture brings about modest improvement in objective parameters, with significant subjective improvement (124). Prospective randomized single-blind studies of the effects of real and sham acupuncture on exercise-induced and metacholine-induced asthma revealed that real acupuncture provided better protection than did sham acupuncture (119), but it failed to modulate the bronchial hyperreactivity to histamine (125). Corticosteroid-dependent bronchial asthma may respond better to acupuncture treatment than other types: the required dosage of corticosteroids gradually decreases during the first weeks of acupuncture treatment (126). Acupuncture may also provide symptomatic improvement in the late stages of bronchial asthma, where there are complications of disabling breathlessness due to impaired lung function (127).

2.5 Digestive disorders

Epigastric pain is a common symptom in diseases of the stomach, including peptic ulcer, acute and chronic gastritis, and gastric spasm. Acupuncture provides satisfactory relief of epigastric pain—significantly better than injections of anisodamine or morphine plus atropine, as shown in randomized controlled trials (*128*, *129*). For gastrointestinal spasm, acupuncture is also superior to injections of atropine (*130*), and for gastrokinetic disturbances, the effectiveness of acupuncture is comparable with that of conventional medicine (domperidone) (*131*).

Another common symptom of digestive disorders is nausea and vomiting. This can be due to a disordered function of the stomach, but it is more often a symptom or sign of generalized disorders. Morning sickness, postoperative vomiting, and nausea and vomiting related to chemotherapy are frequently encountered clinically. In all these conditions, acupuncture at point *nèiguān* (PC6) seems to have a specific antiemetic effect. A recent systematic review of trials using acupuncture for antiemesis showed that 11 of 12 randomized placebocontrolled trials, involving nearly 2000 patients, supported this effect. The reviewed papers showed consistent results across different investigators, different groups of patients, and different forms of acupuncture stimulation (132).

Irritable colon syndrome and chronic ulcerative colitis are often difficult to treat with conventional medication. For these diseases, acupuncture may serve as a complementary or alternative therapeutic measure (133, 134).

Because of its analgesic effect, acupuncture can be used in endoscopic examinations, e.g. in colonoscopy. It has been reported that the effect of acupuncture to relieve pain and discomfort during the examination is comparable with that of scopolamine or pethidine with fewer side-effects (135, 136).

There has been extensive research on the effect of acupuncture on the digestive system, with extensive data showing its influence on the physiology of the gastrointestinal tract, including acid secretion, motility, neurohormonal changes and changes in sensory thresholds. Many of the neuroanatomic pathways of these effects have been identified in animal models (137).

Acupuncture shows good analgesic and antispasmodic effects on the biliary tract and, as indicated previously, can be recommended for treatment of biliary colic (62–64). It also has a cholagogic action, which has been demonstrated in experimental studies. In the treatment of biliary colic due to gallstones, acupuncture is not only effective for relieving the colicky pain, but is also useful for expelling the stones. Satisfactory results were reported when electric acupuncture was used in combination with oral administration of magnesium sulfate (138). Acupuncture treatment is also worth trying for chronic cholecystitis, even if there is acute exacerbation (139).

2.6 Blood disorders

Among various blood disorders, leukopenia is the most suitable for acupuncture treatment. In controlled studies, acupuncture has been shown to be more effective than batilol and/or cysteine phenylacetate in the treatment of leukopenia due to chemotherapy (140–142) or benzene intoxication (143, 144).

2.7 Urogenital disorders

Urinary retention due to functional disorders, with no organic obstruction, is often treated with acupuncture. For postpartum or postoperative urinary retention, successful micturition usually occurs immediately after one session of needling (*66*, *145*). It is probably for this reason that controlled studies on this subject have been neglected. However, there has been a report of a randomized controlled trial on traumatic retention of urine, a condition more complicated than postpartum or postoperative retention. In this trial, the efficacy of

acupuncture was remarkably superior to that of intramuscular injection of neostigmine bromide(146).

Acupuncture is not only useful for relieving renal colic, but also for expelling urinary stones (if they are not too large), because it dilates the ureter. Satisfactory results have been obtained in comparisons with conventional medication (7), but it is better to use acupuncture as a complementary measure in conjunction with medication or lithotripsy.

Sexual disorders are often treated with acupuncture, but conclusive results based on methodologically sound clinical studies are still lacking. Acupuncture was shown to be more effective than placebo in the treatment of non-organic male sexual dysfunction, but the improvement was not statistically significant (147). In another randomized controlled trial, acupuncture had a better effect than the control in the treatment of defective ejaculation (no ejaculation during intercourse) (148).

Acupuncture may also be helpful to patients with chronic prostatitis. As shown in a randomized controlled trial, acupuncture was superior to oral sulfamethoxazole in relieving symptoms and improving sexual function (149).

In women, it has been shown that acupuncture can lower urethral pressure and relieve urethral syndrome (150, 151). Acupuncture has also been successfully used as a prophylaxis against recurrent lower urinary tract infections (152).

2.8 Gynaecological and obstetric disorders

Primary dysmenorrhoea, a painful condition, is one of the major indications for acupuncture in the field of gynaecological disorders. The beneficial effect of acupuncture on this condition has been repeatedly reported in controlled trials (153, 154). Acupuncture relieves pain and also regulates the motility of the uterus to facilitate menstrual discharge and further alleviate the pain.

Premenstrual syndrome is characterized by cyclical mood changes and is a common condition in women of fertile age. Acupuncture seems to be helpful to patients with this syndrome. In a controlled study, the majority of the patients receiving acupuncture gained relief from symptoms and no recurrence in the sixmonth follow-up (155).

Although acupuncture was reported to be effective in the treatment of female anovular infertility (156), no methodologically sound, controlled trials have been reported. However, the mechanism of acupuncture in regulating abnormal function of the hypothalamic-pituitary-ovarian axis has been demonstrated in experimental studies. The data suggest that electric acupuncture with relative specificity of acupuncture points could influence some genetic expression in the brain, thereby normalizing the secretion of certain hormones, such as gonadotropin-releasing hormone, luteinizing hormone and estradiol (157). Acupuncture is also worth trying in the treatment of female infertility due to inflammatory obstruction of the fallopian tubes, where it seems to be superior to conventional therapy with intrauterine injection of gentamicin, chymotrypsin and dexamethasone (158).

Acupuncture in pregnant women should be undertaken with care. Needling at some points (namely, on the abdomen and lumbosacral region), as well as strong

stimulation of certain distant points, such as *hégŭ* (LI4), *sānyīnjiāo* (SP6) and *zhìyīn* (BL67), may cause miscarriage. However, this action is useful if induction of labour is desired, such as in prolonged pregnancy; the effect is comparable with that of oxytocin by intravenous drip (159–161).

In early pregnancy, acupuncture at the upper limb points can be used for the prevention and treatment of morning sickness. The efficacy of acupressure at *nèiguān* (PC6) has been reported repeatedly in placebo-controlled studies (*13, 162, 163*). In order to prevent miscarriage induced by needling, acupressure is recommended for the treatment of morning sickness.

Various methods of acupuncture, such as pressure at ear points and moxibustion at *zhìyīn* (BL67) or *zúlínqí* (GB41), have been used to correct abnormal fetal position during the last three months of pregnancy. The success rates in groups treated with these methods were much higher than the occurrence of spontaneous version or in groups treated with knee-chest position or moxibustion at non-classical points (164-167).

Acupuncture stimulates milk secretion after childbirth and can be used to treat deficient lactation due to mental lability or depression. It has been observed that acupuncture elevates the blood prolactin level in women with deficient milk secretion after childbirth; in the majority of cases, lactation starts as the blood prolactin level increases (168). The clinical use of acupuncture to promote lactation has also been demonstrated in a randomized controlled study (169).

2.9 Cardiovascular disorders

Acupuncture is suitable for treating primary hypotension (170, 171) and early essential hypertension (172–176). It has been reported that the influence of acupuncture on hypertension might be related to its regulatory effect on the level of serum nitrogen monoxide (177). For primary hypotension, acupuncture seems to be more effective than general tonics. For mild and moderate essential hypertension, the hypotensive effect of acupuncture is much more potent than that of placebos and is comparable with that of certain conventional hypotensive agents. In addition, acupuncture is often effective for relieving subjective symptoms, and it has no side-effects.

Encouraging results have been reported for a number of controlled studies on the treatment of heart disease with acupuncture, particularly in psychosomatic heart disorders, such as cardiac neurosis (178). In coronary heart disease, acupuncture has been shown by various authors to be effective in relieving angina pectoris. Its beneficial influence has been demonstrated during coronary arteriography. Cardiological, neurophysiological and psychological observations, made in mutually independent studies, indicated that acupuncture improved the working capacity of the heart in patients with angina pectoris and activated autoregulatory cardiovascular mechanisms in healthy persons (179). In controlled studies, acupuncture has provided significantly greater improvement in symptoms and cardiac work capacity than either placebo (180–182) or conventional medication, such as glyceryl trinitrate (183, 184). Dilation of the coronary artery during acupuncture has been shown to be comparable with that observed during intracatheter injection of isosorbide dinitrate (185). In addition, acupuncture has a beneficial effect on the left ventricular function of patients

with coronary heart disease, and is also more effective than nifedipine and isosorbide dinitrate (186). *Nèiguān* (PC6) is the point most commonly used for treating cardiac disorders. The beneficial effect of acupuncture at this point has been demonstrated by serial equilibrium radionuclide angiography (187). Acupuncture also produces haemorrheological improvement (188).

In order to avoid unexpected accidents, however, special attention should be paid to the treatment of heart disease. Acupuncturists must be able to differentiate between angina pectoris and acute myocardial infarction.

2.10 Psychiatric disorders and mental disturbances

Acupuncture is being increasingly used in psychiatric disorders. The effect of acupuncture on depression (including depressive neurosis and depression following stroke) has been documented repeatedly in controlled studies (189–194). Acupuncture is comparable with amitriptyline in the treatment of depression but has fewer side-effects. In addition, acupuncture has been found to be more effective in depressive patients with decreased excretion of 3-methyl-4-hydroxy-phenylglycol (the principal metabolite of the central neurotransmitter norepinephrine), while amitriptyline is more effective for those with inhibition in the dexamethasone suppression test (192). This suggests that these two therapies work through different mechanisms. There have also been reports that, in controlled trials of schizophrenia treatment, acupuncture might have a better effect than chlorpromazine (194, 195).

Acupuncture (auricular acupressure) is much more effective than psychotherapy in the treatment of competition stress syndrome, and is worth further study (196).

The possible use of auricular acupuncture as a treatment for opium dependence was first noted in 1973 (197). It was found that some of the patients whose postoperative pain was relieved by acupuncture were hiding a dependence on opium. In 1979, a study carried out jointly in Hong Kong and London showed that endorphin concentrations were raised by acupuncture in heroin-dependent persons, resulting in successful suppression of withdrawal symptoms. Since then, acupuncture has been used to treat dependence on a variety of substances. Many substance-abuse programmes use acupuncture as an adjunct to conventional treatment (198). Most of the reports are anecdotal, and while there have been several controlled trials (199–202), the findings have not been consistent. This entire field of research is still at an early stage, holding some promise, but requiring larger-scale and more demanding research studies (198).

Acupuncture treatment has also been used in patients who wish to give up smoking. The conclusions of different researchers are conflicting, however. Some favour acupuncture, while others dismiss its value (203–207). Probably the most convincing results are from randomized controlled trials of passive abstinence, with no suggestion or motivation to stop smoking. The patients were told they would receive acupuncture for other purposes, and they were not asked to stop smoking. A comparison of the effects of auricular acupuncture and body acupuncture was made: 70% of the auricular-acupuncture patients and 11% of those receiving body acupuncture either abstained totally from smoking or reduced the amount of consumption by half. In addition, 72% of the auricular-

acupuncture patients experienced disgust at the taste of tobacco (204). However, in contrast, a meta-analysis of seven reports carefully selected from 16 controlled studies of smoking cessation indicated that acupuncture did not have any greater effect than the placebo (208).

Acupuncture has also been reported to be useful for treating alcohol recidivism. In placebo-controlled trials (with acupuncture at nonspecific points as the control), the patients in the treatment group expressed less need for alcohol than did the control patients. Patients in the treatment group also had fewer drinking episodes and admissions to a detoxification centre (209–211). It is interesting to note that in an experimental study on healthy volunteers, acupuncture diminished clinical alcohol intoxication by increasing the alcohol level in expired air and decreasing blood alcohol levels (212).

2.11 Paediatric disorders

Diarrhoea in infants and young children is still a daunting problem worldwide, particularly in developing countries. Acupuncture seems to be worth using, at least as an adjunct to conventional treatments, because it regulates intestinal function and enhances immune response without causing an imbalance in the intestinal flora as do antibiotics (213, 214).

Convulsions due to high fever are not infrequently encountered in infants and young children. In a controlled clinical trial, convulsions stopped two minutes after needling was started, a result superior to that of intramuscular phenobarbital injection (215).

Although the specific treatment for pertussis is antimicrobials, the paroxysmal coughing is usually very distressing. There has been a report that acupuncture could hasten the cure as well as relieving the cough (*87*).

There are two controlled studies indicating that acupuncture may be of some help in the treatment of Tourette syndrome in children (216, 217).

2.12 Disorders of the sense organs

Deaf-mute children were once extensively treated with acupuncture in China, but no methodologically sound reports have ever shown that acupuncture therapy had any real effectiveness. A recent randomized controlled clinical trial on sudden-onset deafness in adults favoured acupuncture treatment (218).

Acupuncture might be useful in the treatment of Ménière disease for relieving symptoms and also for reducing the frequency of attacks. It seems to be more effective than conventional drug therapy (betahistine, nicotinic acid and vitamin B_6) (219).

Tinnitus is often difficult to treat. Traditionally acupunture has been believed to be effective for treating tinnitus, but only two randomized controlled clinical trials are available – with inconsistent results (220, 221).

Unexplained earache that is neither primary (due to ear disease) nor secondary (as referred pain), is often regarded as a manifestation of psychogenic disturbances. Acupuncture has been shown to be effective in this kind of earache in a placebo-controlled trial (222).

Acupuncture might be helpful in the treatment of simple epistaxis unassociated with generalized or local disease, but only one report of a randomized controlled clinical trial is available. This report indicates that auricular acupuncture provides a more satisfactory effect than conventional haemostatic medication (223).

2.13 Skin diseases

In some countries, many skin diseases are customarily treated with acupuncture, but very few controlled studies have been published. In a randomized controlled clinical trial on chloasma, acupuncture had a significantly better effect than vitamins C and E (224).

Some evidence favouring acupuncture treatment of herpes zoster (human (alpha) herpesvirus 3) has been reported. In a randomized controlled trial, laser acupuncture relieved pain and promoted formation of scar tissue much more quickly than treatment with polyinosinic acid (225).

Acupuncture is known to have an antipruritic effect. This has been shown experimentally in volunteers, suggesting that acupuncture could be used in clinical conditions associated with pruritus (226). Acupuncture with dermal needles (seven-star or plum-blossom needles) has traditionally been used in the treatment of neurodermatitis, but confirmation of its effect in a controlled clinical trial was only recently reported (227).

For the treatment of acne vulgaris, acupuncture, particularly ear acupuncture, is worth recommending if the reported therapeutic effects can be further proved (228, 229).

2.14 Cancers

No controlled study has been reported on the efficacy of acupuncture in the treatment of cancer itself. However, acupuncture still has uses in cancer treatments. One is to relieve cancer pain, and the other is to control the adverse reactions to radiotherapy and chemotherapy. For cancer pain, it has been reported that acupuncture provided an immediate analgesic effect similar to that of codeine and pethidine, with a more marked effect after use for two months (230). The effect was comparable with that achieved using the analgesic steps recommended by WHO (231). For radiotherapy and chemotherapy, acupuncture can greatly lessen the adverse reactions in the digestive and nervous systems, as well as providing protection against damage to haematopoiesis (232–237).

2.15 Other reports

Obesity and hyperlipaemia are becoming increasingly important medical issues. If acupuncture could help in reducing body weight and blood lipids, its clinical use could be greatly expanded. Quite a number of reports on this effect have been published, but unfortunately, almost none of them is methodologically sound. There are only two preliminary reports of randomized controlled clinical trials that can be cited here (238, 239), although criticism of the study design cannot be totally avoided.

Acupuncture may be of benefit to patients with non-insulin-dependent diabetes mellitus. Its efficacy has been shown to be superior to that of placebos and comparable with that of tolbutamide (240, 241).

Anisodamine is effective in treating excessive salivation induced by drugs (usually antipsychotics), but acupuncture seems to be more effective (242).

There are also reports on the treatment of Sjögren syndrome (sicca syndrome) (243), Raynaud syndrome (244), Stein–Leventhal syndrome (polycystic ovary syndrome) (244), and Tietze syndrome (costochondritis) (245), which indicate beneficial effects from acupuncture treatment. Since these reports have appeared only in individual papers, confirmation by further study is necessary.

3. Diseases and disorders that can be treated with acupuncture

The diseases or disorders for which acupuncture therapy has been tested in controlled clinical trials reported in the recent literature can be classified into four categories as shown below.

1. Diseases, symptoms or conditions for which acupuncture has been proved – through controlled trials – to be an effective treatment:

Adverse reactions to radiotherapy and/or chemotherapy

Allergic rhinitis (including hay fever)

Biliary colic

Depression (including depressive neurosis and depression following stroke)

Dysentery, acute bacillary

Dysmenorrhoea, primary

Epigastralgia, acute (in peptic ulcer, acute and chronic gastritis, and gastrospasm)

Facial pain (including craniomandibular disorders)

Headache

Hypertension, essential

Hypotension, primary

Induction of labour

Knee pain

Leukopenia

Low back pain

Malposition of fetus, correction of

Morning sickness

Nausea and vomiting

Neck pain

Pain in dentistry (including dental pain and temporomandibular dysfunction)

Periarthritis of shoulder

Postoperative pain

Renal colic

Rheumatoid arthritis

Sciatica Sprain Stroke Tennis elbow

2. Diseases, symptoms or conditions for which the therapeutic effect of acupuncture has been shown but for which further proof is needed:

Abdominal pain (in acute gastroenteritis or due to gastrointestinal spasm) Acne vulgaris Alcohol dependence and detoxification Bell's palsy Bronchial asthma Cancer pain Cardiac neurosis Cholecystitis, chronic, with acute exacerbation Cholelithiasis Competition stress syndrome Craniocerebral injury, closed Diabetes mellitus, non-insulin-dependent Earache Epidemic haemorrhagic fever Epistaxis, simple (without generalized or local disease) Eye pain due to subconjunctival injection Female infertility Facial spasm Female urethral syndrome Fibromyalgia and fasciitis Gastrokinetic disturbance Gouty arthritis Hepatitis B virus carrier status Herpes zoster (human (alpha) herpesvirus 3) Hyperlipaemia Hypo-ovarianism Insomnia Labour pain Lactation, deficiency Male sexual dysfunction, non-organic Ménière disease

Neuralgia, post-herpetic

Neurodermatitis

Obesity

Opium, cocaine and heroin dependence

Osteoarthritis

Pain due to endoscopic examination

Pain in thromboangiitis obliterans

Polycystic ovary syndrome (Stein-Leventhal syndrome)

Postextubation in children

Postoperative convalescence

Premenstrual syndrome

Prostatitis, chronic

Pruritus

Radicular and pseudoradicular pain syndrome

Raynaud syndrome, primary

Recurrent lower urinary-tract infection

Reflex sympathetic dystrophy

Retention of urine, traumatic

Schizophrenia

Sialism, drug-induced

Sjögren syndrome

Sore throat (including tonsillitis)

Spine pain, acute

Stiff neck

Temporomandibular joint dysfunction

Tietze syndrome

Tobacco dependence

Tourette syndrome

Ulcerative colitis, chronic

Urolithiasis

Vascular dementia

Whooping cough (pertussis)

3. Diseases, symptoms or conditions for which there are only individual controlled trials reporting some therapeutic effects, but for which acupuncture is worth trying because treatment by conventional and other therapies is difficult:

Chloasma

Choroidopathy, central serous

Colour blindness Deafness Hypophrenia Irritable colon syndrome Neuropathic bladder in spinal cord injury Pulmonary heart disease, chronic Small airway obstruction

4. Diseases, symptoms or conditions for which acupuncture may be tried provided the practitioner has special modern medical knowledge and adequate monitoring equipment:

Breathlessness in chronic obstructive pulmonary disease

Coma

Convulsions in infants

Coronary heart disease (angina pectoris)

Diarrhoea in infants and young children

Encephalitis, viral, in children, late stage

Paralysis, progressive bulbar and pseudobulbar

4. Summary table of controlled clinical trials

This section provides a tabulated summary of all the controlled clinical trials reviewed for this publication. For each study, information is provided on the author(s), the year of publication, the number of subjects involved, the study design, the type of acupuncture applied, the controls used and the results obtained.

Condition/Study	No.	Design	Test group	Control Group	Results
Abdominal pain in acu	te gastroenteriti	s (see also Gastrointestinal spas	sm)		
Shu et al., 1997 (67)	25:25	Randomized controlled trial	Body acupuncture (manual)	Routine Western medication (intra-muscular atropine and promethazine)	 Relief of pain was observed in: 24 of the test group, starting 1.3 min after acupuncture 17 of the control group, starting 11. 9 min after injection.
Acne vulgaris					
Li et al., 1998 (228)	42:42	Randomized controlled trial	Body acupuncture (manual)	Herbal medication	After 30 days of treatment, a cure was observed in:42.8% of the test group19.0% of the control group.
Wang et al., 1997 (229)	32:20	Group comparison	Auricular acupuncture	Medication (oral vitamin B ₆ and antibiotics, local benzoyl peroxide ointment)	 Acne disappeared after 10 days of treatment in: 19/32 (59%) in the test group. 7/20 (35%) in the control group.
Adverse reactions to ra Xia et al., 1984 (237)	adiotherapy and 49:20	l /or chemotherapy (see also Leu Randomized controlled trial	ukopenia (this includes leu Acupuncture during radiotherapy	kopenia caused by chemotherapy Radiotherapy	 y); Nausea and vomiting) Acupuncture greatly lessened digestive and nervous system reactions (anorexia, nausea, vomiting, dizziness, and fatigue) due to radiotherapy and showed protection against damage to haematopoiesis
Chen et al., 1996 (232)	44:23	Randomized controlled trial	Manual plus electric acupuncture	Western medication (metoclopramide, etc.)	 Gastrointestinal reactions were cured in significantly more of the acupuncture group: 93.2% of test group after 5.8 ± 2.7 days of treatment 65.2% of control group after 9.4 ± 3.4 days of treatment.
Liu et al., 1998 (235)	40:40	Group comparison	Magnetic plus electric acupoint stimulation	Western medication (metoclopramide, etc.)	Acupoint stimulation therapy was comparable with intravenous metoclopramide for gastrointestinal reactions, and with dexamethasone and cysteine phenylacetate (leucogen) for leukopenia. The treatment was effective in: • 87.5% of the test group • 75.0% of the control group.
Wang et al., 1997 (236)	90	Randomized crossover study	Body acupuncture (manual)	Western medication (metoclopramide)	The treatment was effective in:85.6% of the test group61.1% of the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Li et al., 1998 (234)	22:20	Randomized controlled trial	Body acupuncture (manual)	Intravenous injection of albumin, milk fat and amino acid	 Natural killer cell activity and interleukin-2 were raised in the test group, but markedly lowered in the control group. During the 3-week observation period there was: no significant change of leukocyte and thrombocyte counts in the test group considerable lowering of both counts in the control.
Alcohol dependence, see	Dependence, alco	hol			
Alcohol detoxification Thorer et al., 1996 (212)	35	Sham controlled trial	Acupuncture at two different traditional point combinations	Acupuncture at a sham point or no acupuncture	Clinical measurement using tests of equilibrium and ntation, and specific tests of metabolism and elimination of alcohol, formed the basis of the comparison. There was no difference between the sham acupuncture and no acupuncture control groups. After both traditional acupuncture point combinations, clinical effects of alcohol intoxication were minimized, while the alcohol level in the expired air increased and blood alcohol decreased.
Allergic rhinitis (including Chari et al., 1988 (111)	g hay fever) 25:20	Group comparison	Acupuncture	Antihistamine (chlorphenamine)	The treatment effects were better and lasted longer in the test group and produced no adverse effects.
Jin et al., 1989 (<i>113</i>)	100:60	Randomized controlled trial	Acupuncture plus moxibustion	Medication (patent herbal combination: tablets containing Herba Agastachis and Flos Chrysanthemi Indici)	 At follow-up 1 month after 15 days of treatment improvement was observed in: 92/100 in the test group 47/60 in the control group.
Huang, 1990 (<i>112</i>)	128:120	Randomized controlled trial	Acupuncture plus moxibustion	Antihistamine (chlorphenamine)	 Treatment for 14 days was effective in: 97% of the test group 75.8% of the control group.
Wolkenstein et al., 1993 (247)	12:12	Randomized controlled trial	Acupuncture	Sham acupuncture	The results did not indicate a protective effect of acupuncture therapy against allergen-provoked rhinitis.

Condition/Study	No.	Design	Test group	Control Group	Results
Yu et al., 1994 (<i>115</i>)	230:30	Randomized controlled trial	Acupuncture	Antihistamine (oral astemizole plus nasal drip 1% ephedrine)	 At follow-up 1 year after 4 weeks of treatment, improvement was observed in: 94% of the test group 76.7% of the control group.
Liu, 1995 (<i>114</i>)	50:30	Randomized controlled trial	Acupuncture at <i>biqiu</i> (located at the round prominence on the lateral mucous membrane of the lateral nasal cavity)	Nasal drip of cortisone plus ephedrine	 The treatment was significantly more effective in the test group. Effective rates were: 86.0% in the test group 76.7% in control group.
Williamson et al., 1996 (<i>116</i>)	102	Randomized controlled trial	Acupuncture	Sham acupuncture	 The therapeutic effects were similar in the two groups. In the 4-week period following the first treatment, remission of symptoms was seen in: 39% of the test group; mean weekly symptom scores, 18.4; mean units of medication used, 4.1 45.2% of the control group; mean weekly symptom scores, 17.6; mean units of medication used, 5.0.
Angina pectoris, see C					
		disorders (see also Dysphagia		,	
Zhang et al., 1994 (<i>102</i>)	22:22	Randomized controlled trial	Scalp acupuncture	Conventional supportive measures	Assessed by a scoring method, the therapeutic effect was much better in the test group than in the control group. Before treatment, the two groups were comparable in various respects, including causal diseases and area of lesions.
		is; Peri rthritis of shoulder; Rheu	matoid arthritis		
Asthma, see Bronchial Bell's palsy	asınma				
You et al., 1993 (<i>106</i>)	25:25	Randomized controlled trial	Blood-letting acupuncture	Medication (vasodilator plus steroid, etc.)	 A cure was achieved in: 96% of the test group 68% of the control group.
Lin, 1997 (<i>105</i>)	198:60	Group comparison	Through acupuncture (puncture of two or more adjoining points with one insertion)	Traditional acupuncture	 After a 2-week treatment the cure rate was: 90.9% in the test group 76.7% in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Biliary colic (see also (Cholecystitis, chi	ronic, with acute exacerbation)			
Mo, 1987 (62)	70:76	Group comparison	Acupuncture	Medication (injection of atropine plus pethidine	The analgesic effect was better in the test group than in the control group.
Yang et al., 1990 (64)	50:50	Group comparison	Electric acupuncture	Medication (injection of anisodamine (a Chinese medicine, structurally related to atropine, isolated from <i>Anisodus tangutica</i>) plus pethidine)	 Total relief of colic was achieved in 1–3 min in: 36/50 (72%) in the test group 12/50 (24%) in the control group. Partial relief was achieved in 5–10 min in: 10/50 in the test group 32/50 in the control group.
Wu et al., 1992 (63)	142	Group comparison	Acupuncture	Anisodamine	 The treatment was effective in: 94.3% of the test group 80.0% of the control group.
		al syndrome; Neuropathic bladder i	n spinal cord injury		
Breathlessness in chr					
Jobst et al., 1986 (<i>127</i>)	12:12	Randomized controlled trial	Acupuncture	Placebo acupuncture (needling at non-acupuncture "dead" points)	After 3 weeks of treatment, the test group showed greater benefit in terms of subjective scores of breathlessness and 6-min walking distance. Objective measures of lung function were unchanged in both groups.
Bronchial asthma					
Yu et al., 1976 (123)	20	Randomized cross-over	Acupuncture	Isoprenaline or sham acupuncture	Isoprenaline was more effective than real acupuncture. Both were more effective than sham acupuncture.
Tashkin et al., 1977 (<i>121</i>) (methacholine- induced)	12	Randomized cross-over	Acupuncture	Isoprenaline or placebo	Isoprenaline was more effective than acupuncture. Both were more effective than placebo.
Fung et al., 1986 (<i>119</i>) (exercise-induced)	19	Randomized single- blind crossover	Acupuncture	Sham acupuncture	Real acupuncture provided better protection against exercise-induced asthma than did sham acupuncture.
Tandon et al., 1989 (<i>125</i>) (histamine-induced)	16	Double-blind cross-over	Acupuncture	Acupuncture at irrelevant points	Treatment with real or placebo acupuncture failed to modulate the bronchial hyperreactivity to histamine, suggesting that a single treatment is unlikely to provide improvement in the management of acute bronchial asthma.

Condition/Study	No.	Design	Test group	Control Group	Results
He et al., 1994 (<i>120</i>)	48:48	Randomized group comparison	Laser acupuncture	Moxibustion at same points as laser acupuncture	Pulmonary ventilation indices improved in:33 of the test group20 of the control group.
Xie et al., 1996 (<i>122</i>)	100	Randomized controlled trial with partial crossover	Electric acupuncture at fèishū (BL13) (n = 30)	Electric acupuncture at shàoshāng (LU11) (n =24) yújì (LU10) (n = 24), tàiyuān (LU9) (n = 30), jīngqú (LU8) (n = 28), lièquē (LU7) (n = 28) or qiūxū (GB40) (n = 24)	 An anti-asthmatic effect was observed in: 28/30 of the test group (BL13); best immediate effect 20/24 LU11, 22/24 LU10, 24/30 LU9, 24/28 LU8, 21/28 LU7; good effect 4/24 GB40; least effect.
Biernacki et al., 1998 (<i>248</i>) (stable asthma)	23	Randomized controlled trial, double-blind crossover	Acupuncture	Sham acupuncture	There was no improvement in aspects of respiratory function measured after acupuncture or sham acupuncture. There was significant improvement in the Asthma Quality of Life Questionnaire and a parallel reduction in bronchodilators.
Bulbar paralysis after s Ding, 1996 (249)	stroke (see also D 120:30	ysphagia in pseudobulbar para Group comparison with comparable conditions	lysis) Acupuncture	Conventional Western medication (troxerutin, piracetam, Cerebrolysin: a brain peptide preparation)	 Average recovery time was: 91 (75.8%) in test group after 5.6 days of treatment 12 (40%) in control group after 12 days of treatment.
Cancer pain Dang et al., 1995 (<i>230</i>) (stomach carcinoma)	16:16	Randomized controlled trial	Acupuncture	Western medication (codeine, pethidine)	 Acupuncture treatment had: immediate analgesic effect similar to Western medication more marked analgesic effect than Western medication after long-term use for 2 months.
Dan et al., 1998 (<i>231</i>)	34:37:42	Group comparison	Body acupuncture or acupuncture plus medication	Medication (analgesic steps recommended by WHO)	 An analgesic effect was observed in: 50.0% of the medication group 73.0% of the acupuncture group 92.2% of acupuncture plus medication group.
Cardiac neurosis Zhou, 1992 (178)	30:30	Randomized controlled trial	Acupuncture at rénying (ST9)	Medication (propranolol)	At follow-up I month after 10 days of treatment the therapeutic effect was better in the test group than in the control group.

Chloasma Luan et al., 1996 (224)	60:30	Randomized controlled trial	Auricular acupuncture plus acupressure	Vitamins C and E	 After 3 months of treatment cure was achieved in: 53.3% of the test group 13.3% of the control group. The treatment was effective in: 95.0% of the treatment group
	10				• 43.3% of the control group.
Gong et al., 1996 (139)		erbation (see also Biliary colic) Group comparison	Body plus ear acupuncture	Conventional Western medication (unspecified)	 Clinical cure (disappearance of symptoms and signs, and marked improvement of gallbladder motor function as shown by ultrasonic examination) was achieved in: 92.5% of the test group 32.1% of the control group.
Cholelithiasis					
Zhao et al., 1979 (<i>138</i>)	522:74	Group comparison	Electric acupuncture plus oral magnesium sulfate	Oral magnesium sulfate	 Stones were excreted in: 409/522 (78.4%) in the test group 20/74 (27.4%) in the control group.
		se, see Breathlessness in chronic	obstructive pulmonary dis	ease	
	see Dependence	e, opium, cocaine, heroin			
Colour blindness Cai, 1998 (250)	44:65: 53	Group comparison	Body acupuncture or ear acupressure	No treatment	 After 1–3 courses of treatment (7–12 days each course), colour discrimination was improved: from 0.24 to 0.46 in acupuncture group from 0.27 to 0.52 in ear acupressure group. There was no improvement in the control group (change from 0.28 to 0.30).
Coma Frost, 1976 (<i>108</i>)	17:15	Group comparison with similar levels of coma	Acupuncture at shéntíng (GV24) and shuĭgōu (GV26)	No acupuncture	 A neurological recovery of 50% or more (significant difference) was observed in: 59% of the test group 20% of the control group.
Competition stress sy Que et al., 1986 (<i>196</i>)	ndrome 111:102	Randomized controlled trial	Auricular acupressure	Psychotherapy plus placebo drug	The treatment was effective in:92.8% of the test group7.8% of the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Convulsions in infants	and young children				
He et al., 1997 (<i>215</i>)	51:51	Randomized controlled trial	Acupuncture at <i>hégŭ</i> (Ll4)	Intramuscular phenobarbital	Convulsions stopped 2 min after starting treatment in: 98% of the test group 51% of the control group.
Coronary heart diseas	e (angina pectoris)				
Ballegaard et al., 1986 (<i>180</i>)	13:13	Randomized controlled trial	Acupuncture	Sham acupuncture (insertion of needles outside the meridians)	Cardiac work capacity (difference in pressure-rate product (dPRP)) between rest & maximum exercise & maximum PRP during exercise, was measured. No adverse effect was observed. Patients receiving active acupuncture showed significant increase in cardiac work capacity compared to those receiving sham acupuncture.
Ballegaard et al., 1990 (<i>181</i>)	24:25	Randomized controlled trial	Acupuncture	Sham acupuncture	There was a median reduction of 50% in anginal attack rate and glyceryl trinitrate consumption in both groups, with no significant difference between the groups. The increase in exercise tolerance and delay of onset of pain was significant in the test group; there were no significant changes in the control group.
Xue et al., 1992 (<i>186</i>)	42:27	Randomized controlled trial	Acupuncture	Medication (nifedipine plus isosorbide dinitrate)	Acupuncture was more effective in improving symptoms and ECG and pulse doppler ultrasonocardiography indices.
Mao et al., 1993 (<i>184</i>)	30:30	Randomized controlled trial	Acupuncture plus conventional medication	Conventional medication (glyceryl trinitrate, aspirin, calcium antagonist)	 Improvement in symptoms and ECG, respectively, were observed in: 85.7% and 69% of the test group 57.1% and 38% of the control group.
Dai et al., 1995 (<i>182</i>)	20:18	Randomized controlled trial	Auricular acupuncture at point heart	Auricular acupuncture at point stomach	Marked relief of angina pectoris and other symptoms, with improvement of ECG & haemorr- heological indices was observed in the test group. There was no such effect in the control group.
Cheng, 1995 (<i>183</i>)	50:50	Randomized controlled trial	Auricular acupressure	Conventional medication (glyceryl trinitrate, etc.)	 A marked effect (no recurrence of angina during the 4–5 weeks of treatment) was observed in: 74% of the test group 52% of the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Ma et al., 1997 (251)	30:24	Randomized controlled trial	Body acupuncture plus routine Western medication (aspirin, nitrates and calcium antagonist)	Routine Western medication (aspirin, nitrates and calcium antagonist)	 After 10 days of hospitalization and treatment, improvement in angina pectoris and ST-T, respectively, was observed in : 85.7% and 69% of the test group 58.3% and 33.3% of the control group. Levels of serotonin, noradrenaline and dopamine were higher than normal in both groups but were significantly lowered only in test group after the treatment.
Craniocerebral injury,		0			
Ding et al., 1997 (252)	50:50	Group comparison	Body acupuncture	Routine Western medication (unspecified)	 After 15 days of treatment, clinical cure (disappearance of the main clinical symptoms and signs, and basic recovery of functions) was observed in: 86% of the test group 56% of the control group.
Deafness, sudden ons					
Wang et al., 1998 (<i>218</i>)	50:50	Randomized controlled trial	Body acupuncture plus routine Western treatment (dextran, dexamethasone, etc.)	Routine Western medication (dextran, dexamethasone, etc.)	 After 2 weeks of treatment, the effect was highly statistically significant in: 90% of the test group 70% of the control group.
Defective ejaculation,					
Shui, 1990 (<i>148</i>)	30:30: 40	Randomized controlled trial	Acupuncture	Herbal medication or the Goboes and Liu regimens (treatment included sex instruction, electric massage, hormonal therapy and injection of strychnine and galantamine	 After 1 month of treatment, the cure rate was: 83.3% in the test group 56.7% in the herbal medication group 12.5% in the control Goboes and Liu regimen group.
Dental pain					
Sung et al., 1977 (78) (postoperative)	40	Randomized controlled trial	Acupuncture plus placebo drug	Sham acupuncture plus placebo drug, sham acupuncture plus codeine, or acupuncture plus codeine	Acupuncture plus placebo drug gave significantly greater pain relief than sham acupuncture plus placebo drug or sham acupuncture plus codeine. Acupuncture plus placebo drug was more effective than acupuncture plus codeine in initial 30 min after surgery; less effective 2–3 h after surgery.
Zheng et al., 1990 (79) (after pulp devitalization)	15:11	Randomized controlled trial	Auricular acupressure	No treatment	 After 48 h, there was no pain in: 12/15 (80%) in the test group 4/11(36%) in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Lao et al., 1995 (77) (after tooth extraction)	11:8	Randomized controlled trial	Acupuncture	Placebo acupuncture	Subjects treated with acupuncture reported a significantly longer period without pain and experienced less intense pain than controls.
Sukandar et al., 1995 (80) (apical periodontitis)	20:20	Randomized controlled trial	Electric acupuncture	Mock electric acupuncture	 Analgesic effect lasting 24 h was obtained in: 65% of the test group 10% of the control group.
Lao et al., 1999 (73) (after oral surgery)	19:20	Randomized controlled trial	Acupuncture	Placebo acupuncture	 Acupuncture was statistically significantly superior to the placebo in preventing postoperative dental pain. Mean pain-free postoperative time and minutes before requesting pain relief medication, respectively, were: 172.9 min and 242.1 min in the test group 93.8 min and 166.2 min in the placebo group.
Dependence, alcohol Bullock et al., 1987 (<i>210</i>)	27:27	Randomized controlled trial	Acupuncture at specific points	Acupuncture at non-specific points	There was a significant difference between the two groups at the end of the study; patients in the test group expressed less need for alcohol, with fewer drinking episodes.
Bullock et al., 1989 (<i>211</i>)	40:40	Randomized controlled trial	Acupuncture at specific points	Acupuncture at non-specific points	Significant treatment effects persisted at the end of the 6-month follow-up; more control patients expressed a moderate–strong need for alcohol and had more than twice the number of drinking episodes & admissions to detoxification centres.
Dependence, opium, c Margolin et al., 1993 (<i>201</i>) (cocaine)	ocaine and heroin 32 per group	Group comparison (post hoc)	Auricular	Desipramine, amantadine or drug placebo	 Abstinence rates during final 2 weeks of 8-week treatment were: auricular acupuncture 44% desipramine 26% amantadine 15% drug placebo 13%.
Washburn et al., 1993 (202) (heroin)	100	Randomized controlled trial	Acupuncture	Sham acupuncture	Self-reported frequency of heroin use was lower in the test group.
Cai et al., 1998 (200) (heroin, late stage of abstinence)	60:60	Randomized controlled trial	Body acupuncture	Vitamin B ₁	Reduction of anorexia, spontaneous sweating and insomnia in the late stage of abstinence was greater in test group, and statistically significant.

Condition/Study	No.	Design	Test group	Control Group	Results
Bullock et al., 1999 (<i>199</i>) (cocaine)	236	Randomized controlled trial	Auricular acupuncture	Acupuncture at sham ear points or conventional treatment without acupuncture	The data failed to identify significant treatment differences among the various groups.
Dependence, tobacco					
Fang, 1983 (<i>204</i>)	33:28	Randomized controlled trial (patients told they were receiving acupuncture for other purposes)	Auricular acupuncture	Body acupuncture	 Under a regime of passive abstinence with no suggestion or motivation, auricular acupuncture was superior to body acupuncture in reducing the tobacco consumption by more than half in: 70% of the auricular acupuncture group (72% experienced disgust at the taste of tobacco and 15% felt dizzy during smoking) 11% of the body acupuncture group.
Clavel et al., 1985 (253)	224:205: 222	Randomized group comparison	Acupuncture	Nicotine gum or minimal intervention (cigarette case with lock controlled by a time switch, which could be regulated at will)	 Acupuncture and nicotine gum did not reduce the tendency to relapse after one month but were effective in helping smokers to stop smoking during the first month in: 43/224 in the acupuncture group 46/205 in the group receiving nicotine gum 8/222 in the minimal intervention group.
He et al., 1997 (<i>205</i>)	23:23	Randomized controlled trial	Acupuncture at points used to assist smoking cessation	Acupuncture at points assumed to have no effect on smoking cessation	Daily cigarette consumption fell during the treatment in both groups, but the reduction was larger in the test group. Serum concentrations of cotinine and thiocyanate were significantly reduced after the treatment period in the test group but not in the control group.
White et al., 1998 (<i>207</i>)	76	Randomized controlled trial	Electric acupuncture at appropriate points in each ear	Sham procedure (auricular acupuncture over the mastoid bone)	There was no significant difference between the two groups in the mean score for reduction of withdrawal symptoms.
Waite et al., 1998 (<i>206</i>)		Randomized controlled trial	Electric acupuncture plus self-retained ear seed (a herbal seed used to apply pressure to the point) at an active site	Auricular acupuncture plus self-retained ear seed at a placebo site	 The test acupuncture was significantly more effective in helping volunteers to quit smoking than the control treatment. Cessation of smoking at 6 months in: 12.5% of the test group 0% of the control group.
Depression (see also D Luo et al., 1985 (<i>191</i>)	epression after stroke) 27:20	Randomized controlled trial	Electric acupuncture	Medication (amitriptyline)	There was a similar improvement in the two groups but far fewer side-effects in the test group.

Condition/Study	No.	Design	Test group	Control Group	Results
Luo et al., 1988 (<i>192</i>)	133:108	Multicentre, randomized controlled trial	Electric acupuncture	Medication (amitriptyline)	There was a similar improvement in the two groups but a greater effect on anxiety and fewer side-effects in the test group.
Yang et al., 1994 (193)	20:20	Randomized controlled trial	Acupuncture	Medication (amitriptyline)	There was a similar improvement in the two groups after 6 weeks.
Luo et al., 1998 (<i>254</i>)	29	Randomized controlled trial	Electric acupuncture plus placebo	Electric acupuncture plus amitriptyline	The therapeutic efficacy was similar in the two groups for depressive disorders. The therapeutic effect for anxiety somatization and cognitive process disturbance was greater and there were fewer side-effects in the test group.
Depression after strok			<i>"• ·</i> · · · · · · · · · · · · · · · · ·	•• • • • • • • • •	
Li et al., 1994 (<i>190</i>)	34:34: 33	Randomized controlled trial	"Antidepressive" acupuncture (different selection of points)	Medication (doxepin) plus traditional acupuncture or traditional acupuncture alone	There was a similar improvement in the anti- depressive acupuncture and medication plus traditional acupunture groups; improvement was superior to that in traditional acupuncture group.
Hou et al., 1996 (<i>189</i>)	30:30	Randomized controlled trial with independent assessment	Electric acupuncture at <i>băihuì</i> (GV20) and <i>yìntáng</i> (EX-HN3)	Traditional manual acupuncture	The results were better in the test group; the difference was significant as assessed by the Hamilton and other scoring methods.
Depressive neurosis Zhang, 1996 (<i>194</i>)	31 per group	Randomized controlled trial	Laser acupuncture	Conventional antidepressant (doxepin, amitriptyline or aprazolam)	The therapeutic effect was similar in the two groups, somewhat better in the test group for cognitive disturbance. Side-effects occurred in all cases in control group but in none in test group.
Diabetes mellitus, non		Devidencia el controllo d	A	A summature at 4 Ohim and in sh	These was a solution in faction black as so of
Latief, 1987 (241)	20:20	Randomized controlled trial	Acupuncture at sānyīnjiāo (SP6)	Acupuncture at 1 Chinese inch (<i>cun</i>) superiolateral to SP6	 There was a reduction in fasting blood sugar of: 19.2% in the test group 4.9% in the control group.
Kang et al., 1995 (<i>240</i>)	12:15: 13:10	Randomized controlled trial	Untimed acupuncture or acupuncture at insulin secretion climax (ISCA) or acupuncture at insulin secretion valley (ICSV)	Conventional Western medication (tolbutamide)	 Improvement in fasting blood glucose, 2-h glucose, postprandial blood glucose, 24-h urine glucose, and glucosylated haemoglobin was: marked in the ISCA group superior in the ISCA group to that in the untimed acupuncture and ISVA groups similar in the ISCA group to that of the tolbutamide group.

Condition/Study	No.	Design	Test group	Control Group	Results
		hildren; Dysentery, acute bacilla	ry; Irritable colon syndrom	e	
Diarrhoea in infants a Li et al., 1997 (<i>213</i>)	and young childre 380:450	n Group comparison	Acupuncture at <i>zúsānl</i> ĭ (ST36) and <i>chángqiáng</i> (GV1)	Medication (gentamicin or haloperidol)	 Cure in 1 day was obtained in: 82.3% of the test group (the remainder were cured within 3 days) 41.3% of the control group.
Yang, 1998 (214)	100:70	Group comparison	Body acupuncture and moxibustion	Medication (antibiotics and vitamins)	 Cure was obtained in: 98% of test group within 3.43 ± 0.32 days 80% of control group within 4.41 ± 0.43 days.
Dysentery, acute bac Qiu et al., 1986 (9)	596:281	Group comparison	Acupuncture	Medication (furazolidone)	 Acupuncture relieved symptoms earlier than furazolidone. Stool culture became negative in: 92.4% of the test group 98.2% of the control group.
Li, 1990 (8)	276:269	Group comparison	Acupuncture	Medication (syntomycin, furazolidone)	 Stool culture became negative in all patients after 7 days, but within 7 days in: 87.7% of the test group; recurrence rate in 1 year, 2.4% 74.2% of the control group; recurrence rate in 1 year, 2.5%.
Yu et al., 1992 (<i>10</i>)	162:164	Randomized controlled trial	Acupuncture	Medication (furazolidone)	 Both treatments relieved symptoms and signs, with no side-effects. Stool culture became negative in: 128 (79%) in the test group by 5.1 days; recurrence at 9-month follow-up in 4 cases 143 (87.2%) in the control group by 3.2 days; recurrence at 9-month follow-up in 5 cases.
Dysmenorrhoea, prin Helms, 1987 (<i>153</i>)	nary 11:11:11: 10	Randomized controlled trial, comparing four groups	Acupuncture	Placebo acupuncture, no acupuncture but conventional treatment, no acupuncture but conventional treatment and control visits to physician	 Improvement was observed in: 10/11(90.9%) in the real acupuncture group 4/11 (36.4%) in the placebo acupuncture group 2/11 (18.2%) in the conventional treatment control group 1/10 (10%) in the conventional treatment plus visits control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Shi et al., 1994 (<i>154</i>)	120:44	Randomized controlled trial	Acupuncture at sānyīnjiāo (SP6)	Medication (a paracetamol– propyphenazone–caffeine combination)	A better and quicker analgesic effect was observed in the test group.
Dysphagia in pseudob Liu et al., 1998 (<i>255</i>)	ulbar paralysis 30:30	Randomized controlled trial	Body acupuncture	Logemann functional training of lingual muscles	Cure rates after 15 days were: 26 in the test group (average 8.7 days) 6 in the control group.
Earache, unexplained Mekhamer A et al. 1987 (<i>222</i>)	96	Randomized controlled trial	Acupuncture	Mock TENS	The response was significantly better following acupuncture than placebo for both 33% and 50% pain-relief criteria.
Encephalitis, see Viral		n			
Epidemic haemorrhagi Song et al., 1992 (<i>86</i>)	c fever 38:32	Randomized controlled trial	Moxibustion	Western medication. (steroid, supportive treatment)	Moxibustion shortened the period of oliguria and accelerated the fall in urine protein and reduction in kidney swelling (ultrasound).
Epigastralgia, acute (ir Xu et al., 1991 (<i>128</i>)	1 peptic ulcer, acute 42:31	and chronic gastritis, and Randomized controlled trial	gastrospasm) Acupuncture at <i>liángqiū</i> (ST34) and <i>wèishū</i> (BL21)	Conventional medication. (anisodamine)	The treatment was effective in:97.6% of the test group83.9% of the control group.
Yu, 1997 (<i>129</i>)	160:40	Randomized controlled trial	Acupuncture (manual) at <i>zúsānlĭ</i> (ST36)	Medication (morphine plus atropine)	 A marked effect was observed in: 81% of the test group 80% of the control group.
Epistaxis, simple (with Lang et al., 1995 (223)	out generalized or lo 92:42	ocal disease) Randomized controlled trial	Auricular acupuncture with thumb-tack needle	Western medication (carbazochrome salicylate plus vitamin C)	Cure (no recurrence at 3-month follow-up) was observed in: • 84.8% of the test group • 28.6% of the control group.
Eye pain due to subco Shen, 1996 (<i>14</i>)	njunctival injection 24:15	Randomized controlled trial	Acupuncture at <i>bìnào</i> (LI14)	No treatment	Pain mostly disappeared in 0.5–1 min in 22/24 of the test group but persisted for 30–60 min in all of the control patients.
Facial pain (including Hansen et al., 1983 (29)	craniomandibular di 16	sorders) (see also Temporo Randomized crossover trial	mandibular joint dysfunctic Acupuncture	on) Sham acupuncture	Pain levels were more significantly reduced following acupuncture than following sham acupuncture.

Condition/Study	No.	Design	Test group	Control Group	Results
Johansson et al., 1991 (<i>30</i>)	15 per group	Randomized controlled trial	Acupuncture	Occlusal splint or no treatment	Acupuncture was as effective as occlusal splint. At follow-up, subjective dysfunction scores and visual analogue scale assessments were significantly lower in the test group.
List, 1992 (<i>31</i>)	110	Randomized controlled trial	Acupuncture.	Occlusal splint or no treatment	Symptoms were reduced by acupuncture and occlusal-splint therapy. The control group remained essentially unchanged. Acupuncture gave better short-term subjective results than occlusal splint.
Cai, 1996 (<i>28</i>)	32:36	Randomized controlled trial	Acupuncture with retention of needles for 1–1.5 h	Acupuncture with retention of needles for 0.5 h	 Marked effect (with effective rate after course of treatment of 14 sessions): 59.3% of test group after 5 sessions of treatment; overall effective rate, 93.7% 25% of the control group after 11 sessions on average; overall effective rate, 77.8%.
Facial spasm Liu, 1996 (<i>107</i>)	33:33	Randomized controlled trial	Wrist–ankle acupuncture	Body acupuncture	 Elimination of involuntary twitching with no recurrence at 6-month follow-up in: 69.7% of the test group 39.4 % of the control group.
Female urethral syndro					
Zheng et al., 1997 (<i>151</i>)	103:50	Randomized controlled trial	Body acupuncture and moxibustion.	Medication (Urgenin: herbal extract containing <i>Serenoa</i> <i>serrulata</i> , effective for irritable bladder; used because antibiotics had proved ineffective in all patients)	 Effective rates after 1–2 months of treatment were: 88.3% in the test group 28% in the control group.
Wang et al., 1998 (<i>150</i>) (from same institute as study above)	56:37	Randomized controlled trial	Body acupuncture and moxibustion	Medication. (Urgenin; used because antibiotics had proved ineffective)	 Effective rates after 1–2 months of treatment were: 87.5% in the test group (urodynamic study also showed the beneficial effect of acupuncture) 29.7% in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Fever, see Convulsions	in infants and yo	ung children due to high fever; To	onsillitis, acute		
Fibromyalgia					
Deluze et al.,1992 (40)	36:34	Randomized controlled trial with independent assessment	Acupuncture	Sham acupuncture	 There was a significant difference between the two groups with improvement in: 7 of the 8 parameters in the test group none of the parameters in the control group.
Gastrointestinal spasn					
Shi et al., 1995 (<i>130</i>)	100:100	Randomized controlled trial	Acupuncture	Atropine	 Total relief of pain in 30 min was observed in: 98 in the test group 71 in the control group.
Gastrokinetic disturba					
Zhang et al., 1996 (<i>131</i>)	104:41	Randomized controlled trial	Acupuncture	Conventional medication (domperidone)	 Effective rates (no significant difference between the two groups) were: 95.2% in the test group 90.2% in the control group.
Gouty arthritis					-
Li et al., 1993 (<i>60</i>)	23:19	Randomized controlled trial	Blood-pricking acupuncture	Conventional medication (allopurinol)	The test group showed more marked improvement than the control group. Reduction in blood and urine uric acid was similar in the two groups.
Pan, 1997 (61)	39:20	Randomized controlled trial	Plum-blossom needling plus cupping	Medication (allopurinol)	 After 6 weeks of treatment, marked improvement was observed in: 100% of the test group 65% of the control group.
Haemorrhagic fever, se					
Hay fever, see Allergic I	hinitis (including	hay fever)			
Headache Ahonen et al., 1983 (<i>17</i>) (myogenic)	12:10	Group comparison	Acupuncture	Physiotherapy	Significant changes in pain and electromyogram in both groups, with 4 sessions of acupuncture equivalent to 8 sessions of physiotherapy.
Loh et al., 1984 (23) (migraine and tension)	48	Crossover (incomplete)	Acupuncture	Standard drug therapy (mainly propranolol)	 Benefit was observed in: 59% of the test group; 39% with marked improvement 25% of the control group; 11% with marked improvement.

Condition/Study	No.	Design	Test group	Control Group	Results
Dowson et al., 1985 (20) (migraine)	25:23	Randomized controlled trial	Acupuncture	Mock TENS	 33% severity improvement was observed in: 56% (14/25) of the acupuncture group 30% (7/23) of the control group. Headache frequency was reduced in: 44% (11/25) of the acupuncture group 57% (13/23) of the control group.
Doerr-Proske et al., 1985 (<i>19</i>) (migraine)	10 per group	Randomized controlled trial	Acupuncture	Psychological biobehavioural treatment or no treatment (on waiting list)	Over 3 months of treatment, there was a significant reduction of headache frequency and intensity in the acupuncture and psychological biobehavioural groups. There was almost no change in those on the waiting list.
Vincent, 1989 (25) (migraine)	15:15	Randomized controlled trial	Acupuncture	Sham acupuncture	There was a significant difference between two groups: the test group experienced sustained improvement over 1 year after only 6 treatments in a 6-week period.
Tavola et al., 1992 (<i>24</i>) (tension)	15:15	Randomized controlled trial	Acupuncture	Sham acupuncture	 The mean decreases in headache episodes, headache index and analgesic intake, respectively were: 44.3%, 58.3% and 57.7% in the test group 21.4%, 27.8% and 21.7% in the control group.
Kubiena et al., 1992 (21) (migraine)	15:15	Randomized controlled trial	Acupuncture	Placebo acupuncture	The test group showed better results than the control group (reduction in frequency of attacks, intensity of pain and amount of medication taken).
Xu et al., 1993 (27) (migraine)	50:50	Randomized group comparison	Manual acupuncture	Electric acupuncture	 There was an Immediate analgesic effect in: 80% of the test group 48% of the control group.
Weinschütz et al., 1994 (26) (migraine)	20:20	Controlled trial, comparable pretreatment conditions	Acupuncture at classical points	Acupuncture at points 1–2 cm from those used in test group	Acupuncture at classical points yielded a significant therapeutic effect superior to the control acupuncture.
Chen et al., 1997 (<i>18</i>) (migraine)	45:30	Group comparison	Penetrating acupuncture	Nimodipine	 After 20 days of treatment, headache disappeared with no recurrence after 6 months of follow-up in: 30/45 in the test group 16/30 in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Liu et al., 1997 (22) (migraine)	30:34	Randomized controlled trial	Scalp acupuncture	Flunarizine	 Headache was relieved after 1 week treatment in 73.3% of the test group 38.2% of the control group.
Heart disease, see Core	onary heart diseas	se (angina pectoris); Pulmonary	heart disease, chronic		
Hepatitis B virus carrie	r				
Wang et al., 1991 (85)	70:42	Group comparison	Acupuncture plus moxibustion	Herbal medication (Herba Cymbopogonis)	 After 3 months of treatment, carrier status became negative in: 30% of the test group 2.4% of the control group. Antibodies to hepatitis B e core antigen were produced in: 50% of the test group 6.25% of the control group.
Heroin dependence, se	e Dependence, o	pium, cocaine, heroin			
Herpes zoster (human	(alpha) herpesvi	rus 3) (see also Neuralgia, post-	-herpetic)		
Chen et al., 1994 (225)	33:32	Randomized controlled trial	Laser acupuncture	Polyinosinic acid	 Disappearance of pain and formation of scabs, respectively, occurred after: 1.48 and 5.76 days of laser acupuncture 10.5 and 10.4 days of medication.
Hyperlipaemia					
Wang, 1998 (239)	40:25	Group comparison	Acupoint injection plus oral administration of simvastatin	Oral administration of simvastatin	 Significant improvement after 30 days of treatment in: 36/40 (90%) in the test group 11/25 (44%) in the control group.
Hypertension, essentia	al				
lurenev et al., 1988 (<i>1</i> 73)	25:38	Group comparison	Acupuncture	Conventional medication (rescinnamine)	The therapeutic efficacy was similar in the two groups.
Zhou et al., 1990 (<i>1</i> 76)	135:68: 71	Group comparison	Auricular acupressure	Medication (nifedipine plus propranolol) or placebo drug	There was a similar improvement with acupressure and medication. Both were superior to placebo.
Yu et al., 1991 (<i>175</i>)	280:51	Group comparison	Auricular acupressure	Conventional medication (reserpine)	There was a similar improvement in the two groups. There were no side-effects in the test group.

Condition/Study	No.	Design	Test group	Control Group	Results
Wu et al., 1997 (<i>174</i>)	82:118	Group comparison	Scalp acupuncture	Conventional medication (nifedipine)	 The effects were similar, with no statistically significant difference, in the two groups: marked response in 47.6%, partial response in 50% of the test group marked response in 57.6%, partial response in 40.7% of the control group.
Dan, 1998 (<i>172</i>)	26:26	Randomized controlled trial	Acupuncture	Conventional medication (nifedipine)	Monitoring of ambulatory blood pressure showed a similar reduction in 24-h systolic and diastolic blood pressure in the two groups. The reduction in myocardial oxygen consumption index was greater in the test group.
Hypo-ovarianism Ma et al., 1997 (256)	30:30	Randomized controlled trial	Body acupuncture (manual) plus cupping	Medication (diethylstilbestrol)	 Marked improvement was observed in: 43/56 (76.8%) in the test group (hormonal assay showed a further long-term effect after treatment) 26/55 (47.3%) in the diethylstilbestrol group.
Hypophrenia Tian et al., 1996 (254)	100:25	Randomized controlled trial	Body plus ear acupuncture plus application of herbal extract to acupoints	No treatment	 Intelligence quotient increased: from 53.97 to 65.07 (11.10 ± 2.96) in the test group from 53.87 to 55.12 in the control group. Social adaptability behaviour increased: from 7.51 to 8.89 (1.38 ± 0.31) in test group from 7.57 to 7.82 in the control group.
Hypotension, primary Guo, 1992 (<i>170</i>)	50:50	Randomized controlled trial	Auricular acupressure	Herbal tonics	 After 10 days of treatment, blood pressure was restored to normal in: 45 in the study group (no improvement in 1) 15 in the control group (no improvement in 25).
Yu et al., 1998 (<i>171</i>)	180:60	Randomized controlled trial	Acupuncture at <i>băihuì</i> (GV20) plus herbal medication (<i>Bu Zhong</i> <i>Yi Qi Tang</i> , a formula that is routinely used in herbal medicine for the treatment of hypotension)	Herbal medication (<i>Bu Zhong</i> Yi Qi Tang)	 A therapeutic effect was observed after 0.5–1 month of treatment in: 172/180 (95.5%) in the test group 46/60 (76.7%) in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Induction of labour Yu et al., 1981 (<i>161</i>)	10:10:8	Randomized group comparison	Acupuncture at distant points or local points	Acupuncture at distant plus local points	Acupuncture at distant points was superior to that at local points in strengthening uterine contractions for induction of labour. Combined use of distant & local points was best technique.
Lin et al., 1992 (<i>159</i>)	62:48	Randomized controlled trial	Acupuncture at <i>hégŭ</i> (LI4) and <i>sānyīnjiāo</i> (SP6)	Oxytocin intravenous drip	Similar results were obtained in the two groups, but uterine contractions were less frequent and uterine motility was less marked in the test group.
Ma et al., 1995 (<i>160</i>)	31:29: 15:26	Randomized controlled trial	 (1) Ear acupuncture at shénmén, (2) Body acupuncture at sānyīnjiāo (SP6) or (3) Body acupuncture at yánglíngquán (GB34) 	(4) No treatment	The duration of labour in the four groups was: • (1) 4.47 \pm 0.76 h • (2) 6.80 \pm 1.04 h • (3) 9.79 \pm 2.45 h • (4) 10.20 \pm 2.04 h.
			flammatory obstruction of f	allopian tube; Male sexual dysfu	nction, non-organic
Infertility due to inflan Ji et al., 1996 (<i>158</i>)	nmatory obstruction 64:36:30	n of fallopian tube Randomized controlled trial	Manual acupuncture plus electric acupuncture plus moxibustion	Herbal medication or conventional Western medication (intrauterine injection of gentamicin, chymotrypsin and dexamethasone)	 Results showed that the fallopian tube obstruction was totally removed in: 81.3% of the test group; in a 2-year follow-up, the pregnancy rate was 75% 55.6% and 56.7% of the control groups, respectively; in a 2-years follow-up, the pregnancy rates were 52.7% and 46.7%.
Insomnia Zhang, 1993 (<i>110</i>)	60 per group	Group comparison	Auricular acupressure	Medication (diazepam plus chlorohydrate)	 After 1 month of treatment, sleep was restored to normal or markedly improved in: 59/60 in the test group 20/60 in the control group.
Luo et al., 1993 (<i>109</i>)	60 per group	Randomized controlled trial	Auricular acupressure	Medication (phenobarbital, methaqualone or meprobamate)	 After the course of treatment, sleep improved in: 96.7% of the test group 35.0% of the control group.
Irritable bladder, see F		Irome		•	
Irritable colon syndro Wu et al., 1996 (<i>133</i>)	me 41:40	Randomized controlled trial	Moxibustion	Western medication	 After 2.5–3 months of treatment, a therapeutic effect was observed in: 92.7% of test group (improvement in 53.7%) 62.5% of control group (improvement in 37.5%).

Condition/Study	No.	Design	Test group	Control Group	Results
Knee pain Maruno, 1976 (<i>56</i>) (arthrosis)	26:26	Randomized controlled trial	Electric acupuncture	Manual acupuncture	 Good results (complete alleviation of pain) were observed in: 17/26 in the test group (average no. of treatments required, 6) 11/26 in the control group (average no. of treatments required, 10).
Christensen et al., 1992 (<i>54</i>) (osteoarthritis)	14:15	Randomized controlled trial, independent assessment	Acupuncture	No treatment (waiting for surgery)	Reduction in pain, analgesic consumption and objective measurements were significantly greated in the test group.
Berman et al., 1999 (58) (osteoarthritis)	73	Randomized controlled trial	Acupuncture	Standard care (weight loss, physical and occupational therapy, medication)	Improvement according to the Western Ontario and McMaster Universities Osteoarthritis Index and Lequesne indices was superior in test group.
Labour, see Induction o	f labour; Labour pain				
Labour pain Zhang et al., 1995 (<i>82</i>)	150:150	Randomized controlled trial with independent assessment	Body plus ear acupuncture	No treatment	Acupuncture yielded a good analgesic effect and expedited the opening of the uterine ostium.
Lactation deficiency Chandra et al., 1995 (169)	15:15	Randomized controlled trial	Electric acupuncture	No acupuncture	 Lactation increased by: 92% in the test group 30.9% in the control group. The difference was statistically significant.
Leukopenia Chen et al., 1991 (<i>141</i>) (chemotherapy- induced)	121:117: 34	Randomized controlled trial	Acupuncture or moxibustion	Medication (batilol plus cysteine phenylacetate)	 Effective rates after 9 days of treatment were: 88.4% in the acupuncture group 91.5% in the moxibustion group 38.2% in the medication group.
Chen et al., 1990 (<i>140</i>) (chemotherapy- induced)	57:34	Randomized controlled trial	Moxibustion	Medication (batilol plus cysteine-phenylacetate)	Effective rates after 9 days of treatment were:89.5% in the test group38.2% in the control group.
Yin et al., 1990 (143) (benzene-induced)	30:27	Randomized controlled trial	Acupuncture	Medication (cysteine- phenylacetate)	 Effective rates after 6 weeks of treatment were: 83.3% in the test group 53.4% in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Yin et al., 1992 (144) (benzene-induced)	30:25	Randomized controlled trial	Acupuncture	Medication (rubidate)	 Acupuncture was superior to rubidate in improving symptoms and increasing leukocyte count; effective rates were: 91% in the test group 68% in the control group.
Wang, 1997 (<i>142</i>) (chemotherapy- induced)	49:34	Randomized controlled trial	Moxibustion	Medication (batilol plus cysteine-phenylacetate)	Effective rates were:82% in the test group50% in the control group.
Low back pain (see als		• • •			
Gunn et al., 1980 (46)	29:27	Randomized controlled trial	Acupuncture	Standard therapy (physical therapy, remedial exercises, etc.)	 Return to original or equivalent work or to lighter work, respectively, was possible in: 18/29 and 10/29 in the test group 4/27 and 14/27 in the control group.
Coan et al., 1980 (<i>45</i>)	25:25	Randomized controlled trial	Acupuncture and electric acupuncture	No treatment (waiting list)	 Improvement was observed in: 19/25 in the test group 5/25 in the control group.
Mendelson et al., 1983 (<i>49</i>)	95	Randomized single- blind crossover with independent assessment	Acupuncture	Lidocaine injection plus sham acupuncture	Improvement was observed in:26 in the test group22 in the control group.
MacDonald et al., 1983 (<i>48</i>)	8:9	Randomized controlled trial	Acupuncture and electric acupuncture	Mock TENS	 Combined average reduction (pain score, activity pain, physical signs) was: 71.4% in the acupuncture group 21.4% in the control group.
Lehmann et al., 1986 (47)	17:18:18	Randomized controlled trial	Electric acupuncture	TENS or mock TENS	There was a significantly greater gain in various measures in the test group during a 3-week in- patient treatment period and at 6-month follow-up.
-	· •	(see also Defective ejaculation)	• •		
Aydin et al., 1997 (<i>147</i>)	15:16:29	Randomized controlled trial	Acupuncture	Hypnosis or placebo	 Success rates were: 60% in the acupuncture group 75% in the group treated with hypnotic suggestion 43–47% in the placebo group.

Condition/Study	No.	Design	Test group	Control Group	Results
Malposition of fetus, c	orrection of				
Qin et al., 1989[(<i>167</i>)	100:40	Group comparison	Auricular acupressure	Knee-chest position	 Success rates were: 92.9% in the test group 67.5% in the control group.
Li et al., 1990 (<i>165</i>)	27:27:20	Group comparison	Moxibustion at <i>zúlínqì</i> (GB41)	Moxibustion at <i>zhiyīn</i> (BL67) (not traditionally used for fetal transposition) or at a non- classical point (located 3 cm below the head of the fibula)	 After 1 week of treatment, successful transposition occurred in: 51.9% of the test group 22.2% and 15%, respectively, in the control groups.
Li et al., 1996 (<i>166</i>)	48:31	Group comparison	Electric acupuncture at <i>zhìyīn (</i> BL67)	No treatment	Efficacy was markedly superior in the test group.
Cardini et al., 1998 (<i>164</i>)	130:130	Randomized controlled trial	Moxibustion at <i>zhìyīn</i> (BL67)	Routine care but no intervention for breech presentation	Among primigravidas with breech presentation during the 33rd week of gestation, moxibustion for 1–2 weeks increased fetal activity during the treatment period and resulted in cephalic presentation after treatment period & at delivery.
Ménière disease Zhang et al., 1983 (219) Migraine, see Headach	33:32	Randomized controlled trial with partial crossover	Acupuncture	Conventional Western medication (betahistine, nicotinic acid, vitamin B ₆ , cinnarizine)	 After 15 days of treatment, the syndrome was relieved in: 25 in the test group (ameliorated in 1), with relief usually occurring immediately after treatment 16 in the control group (ameliorated in 2). Of the 7 unaffected acupuncture patients, 5 returned to receive medication; all remained unimproved. Of the 14 unaffected control patients, 6 returned to receive acupuncture; 2 were cured and 1 improved. Effective rates were: 74.4% in 39 courses of acupuncture treatment 48.6% in 37 courses of medication.
Morning sickness (see		omiting)			
Dundee et al., 1988 (162)	119:112: 119	Randomized controlled trial	Acupressure at <i>nèiguān</i> (PC6) or sham acupressure (a point near right elbow)	No treatment	Troublesome sickness was significantly less in the acupressure (23/119) and sham acupressure (41/112) groups than in the control group (67/119).

Condition/Study	No.	Design	Test group	Control Group	Results
De Aloysio et al., 1992 (258)	66	Randomized controlled trial	Acupressure at <i>nèiguān</i> (PC6)	Sham acupressure	Effective rates were: • 60% in the test group • 30% in the control group.
Bayreuther et al., 1994 (259)	23	Randomized single- blind crossover with independent assessment	Acupressure at <i>nèiguān</i> (PC6)	Sham acupressure	Effective rates were:69% in the test group31% in the control group.
Fan, 1995 (<i>163</i>)	151:151	Randomized group comparison	Moxibustion	Herbal medication	 Cure rates after 1 week of treatment were: 96.7% in the test group 58.9% in the control group.
Nausea and vomiting (see also Adverse read	ctions to radiotherapy and/or	chemotherapy; Morning s	ickness)	
Dundee et al., 1986 (260) (peri- and postoperative)	25 per group	Group comparison	(1) Acupuncture plus meptazinol, (2) Acupuncture plus nalbuphine	(3) Meptazinol (4) Sham acupuncture plus nalbuphine (5) Nalbuphine	Vomiting in group (1) was half that in group (3). There was a significantly lower incidence of emetic episodes in the acupuncture groups (1) and (2) than in the control groups (3), (4) and (5). There were no differences between the control groups (3), (4) and (5).
Dundee et al., 1987 (233) (cisplatin-associated)	10	Randomized crossover trial	Electric acupuncture at <i>nèiguān</i> (PC6)	Electric acupuncture at "dummy" point	Sickness was significantly lower in the test group.
Ghaly et al., 1987 <i>261</i>) (postoperative)	31:31	Group comparison	Acupuncture plus electric acupuncture	Medication (cyclizine)	Acupuncture and electric acupuncture were as effective as medication.
Weightman et al., 1987 (262) (postoperative)	46	Double-blind randomized controlled trial	Acupuncture at <i>nèiguān</i> (PC6)	No acupuncture	Acupuncture performed during surgery under anaesthesia did not lead to a significant reduction in nausea or vomiting after surgery.
Dundee et al., 1989 (263) (chemotherapy-related)	20	Group comparison	Acupuncture at <i>nèiguān</i> (PC6)	Sham acupuncture	Effective rates were: 90% in the test group 10% in the control group.
Barsoum et al., 1990 (<i>264</i>) (postoperative)	162	Randomized controlled trial	Acupressure at <i>nèiguān</i> (PC6) by using bands (with pressure button)	Placebo bands (without pressure button) or injection of prochlorperazine	The severity of nausea was significantly reduced in the test group compared with the two control groups.

Condition/Study	No.	Design	Test group	Control Group	Results
Ho et al., 1990 (265) (postoperative)	25 per group	Group comparison	Electric acupuncture	Medication (intravenous prochlorperazine 5 mg) or TENS or no treatment	 Emesis episodes were observed in: 3/25 in the electric acupuncture group 3/25 in the medication group 9/25 in the TENS group 11/25 in the untreated group.
Ho et al., 1996 (266) (postoperative)	60	Randomized double- blind controlled trial	Acupressure bands (with pressure button)	Placebo bands (without pressure button)	 Incidence of nausea and of vomiting, respectively was: 3% and 0% in the test group 43% and 27% in the control group.
Andrzejowski et al., 1996 (267) (postoperative)	36	Randomized controlled trial	Acupuncture with semipermanent needles	Placebo with needles inserted into sham points	Semipermanent acupuncture did not reduce the overall incidence of nausea and vomiting after abdominal hysterectomy but did reduce the severity of nausea in the second 24-h period and had a greater effect on patients who had nausea & vomiting after a previous anaesthetic.
McConaghy et al., 1996 (<i>268</i>) (postoperative)	30:50	Randomized controlled trial	Acupuncture at <i>nèiguān</i> (PC6)	Acupuncture at sham points	 Patients were treated with acupuncture with manual stimulation for 4 min after developing post-operative nausea & vomiting lasting more than 10 min: 53% of patients in the test group did not require further antiemetic treatment all patients in the control group required further antiemetic treatment.
Schwager et al., 1996 (269) (postoperative)	84	Randomized controlled trial	Acupuncture	Placebo (no needle stimulation)	There was no statistically significant difference in total postoperative vomiting between the two groups.
Liu et al., 1997 (270) (cisplatin-associated)	184: 161:25: 25:23: 22:70	Randomized group comparison	Magnetic plate at <i>nèiguān</i> (PC6): (1) 120 mT, (2) 60 mT or (3) 2000 mT	(4) 120 mT magnetic plate at <i>zúsānlĭ</i> (ST36), (5) iron plate at <i>nèiguān</i> (PC6), (6) steel bead at <i>nèiguān</i> (PC6) or (7) medication (unspecified)	 Total effective rates were significantly higher in the first two test groups): (1) 92.4% (2) 89.4% other group rates ranged from 47.2% (7) to 0%.

Condition/Study	No.	Design	Test group	Control Group	Results
Al-Sadi et al., 1997 (<i>271</i>) (postoperative)	81	Randomized controlled trial	Acupuncture	Placebo (no needle stimulation)	The use of acupuncture reduced the incidence of postoperative nausea or vomiting in hospital from 65% to 35% (for day cases) and from 69% to 31% (after discharge).
Stein et al., 1997 (272) (postoperative)	75	Randomized double- blind controlled trial	Acupressure bands plus intravenous saline	Placebo bands plus intravenous metoclopramide or placebo bands plus intravenous saline	Patients who received either acupressure or placebo bands plus metoclopramide prior to initiation of spinal anaesthesia for caesarean section experienced much less nausea than patients in the placebo band plus saline group.
Schlager et al., 1998 (273) (postoperative)	40:20	Randomized double- blind controlled trial	Laser stimulation of <i>nèiguān</i> (PC6)	Placebo laser	 The incidence of vomiting after strabismus surgery was significantly different for 25% in the test group 85% in the control group.
Chu et al., 1998 (274) (postoperative)	34:31	Randomized controlled trial assessed by evaluator blind to treatment	Acupressure using non-invasive vital point needleless acuplaster (Koa, Japan)	Placebo acupressure	 The overall incidence of vomiting in a 24-h period after strabismus surgery was: 29.4% in the test group 64.5% in the control group.
Alkaissi et al., 1999 (275) (postoperative)	20:20: 20	Randomized controlled trial	Acupressure with wrist band	Placebo with or without wrist band	Nausea decreased after 24 h in all groups but vomiting and need of relief antiemetic was reduced only in the test group.
Shenkman et al., 1999 (276) (postoperative)	100	Randomized controlled trial	Acupuncture plus acupressure	Acupuncture at sham points	Perioperative acupressure and acupuncture did not diminish emesis in children following tonsillectomy.
Neck pain Coan et al., 1982 (<i>35</i>)	15:15	Randomized controlled trial	Acupuncture plus electric acupuncture	No treatment (waiting list)	 Mean pain scores were reduced by: 40% in the test group; improvement in 12/15 2% in the control group; improvement in 2/15.
Loy, 1983 (<i>36</i>)	26:27	Randomized controlled trial	Electric acupuncture	Physiotherapy	 Improvement was observed in: 67.4% of the test group at 3 weeks, 87.2% at 6 weeks 51.3% of the control group at 3 weeks, 53.9% at 6 weeks.

Condition/Study	No.	Design	Test group	Control Group	Results
Petrie et al., 1986 (37)	13:12	Randomized controlled trial	Acupuncture	Mock TENS	 At 1-month follow-up, daily pill count and disability scores, respectively: decreased by 23.5% and 24.6% in the test group increased by 8.4% and 8.4% in control group.
David et al., 1998 (34)	35:35	Randomized controlled trial	Acupuncture	Physiotherapy	Both groups improved in respect of pain and range of movement of neck. Acupuncture was slightly more effective in patients who had higher baseline pain scores.
Birch et al., 1998 (<i>33</i>)	46	Randomized controlled trial	Acupuncture at specific sites relevant for neck pain or acupuncture at specific sites not relevant for neck pain	Nonsteroid anti-inflammatory medication	Relevant acupuncture contributed to modest pain reduction in persons with myofascial neck pain. The relevant acupuncture group had significantly greater pre- and post-treatment differences in pain than the non-relevant acupuncture and medication groups.
Neuralgia, post-herpet Lewith et al., 1983 (<i>103</i>)	t ic 30:32	Randomized controlled trial	Auricular plus body acupuncture	Placebo (mock TENS)	There were no differences in the pain recorded in the two groups during or after treatment. There was a significant improvement in pain at the end of treatment in 7 patients of the placebo group and 7 patients of the acupuncture group.
Sukandar et al., 1995 (<i>104</i>)	7:7	Randomized controlled trial	Acupuncture at <i>jiáj</i> í (EX-B2) on affected side plus amitriptyline– trifluoperazine combo (amitriptyline 5 mg + trifluoperazine 0.5 mg per tablet), one tablet twice a day	Acupuncture at <i>jiáj</i> ĭ (EX-B2) on contralateral side plus an amitriptyline–trifluoperazine combination	 There was a significant difference in analgesia between the test and control groups. Analgesia was excellent in: all patients in the test group after 6 sessions none of the patients in the control group.
Neurodermatitis Huang et al., 1998 (227)	60:60	Randomized controlled trial	Acupuncture with seven-star needles	Conventional local treatment	Cure rates were: • 100% in the test group • 16.7% in the control group.
Neuropathic bladder in Cheng et al., 1998 (277)	n spinal cord injury 40:40	Controlled trial	Electric acupuncture	Conventional bladder-training programme	Times taken to achieve balanced voiding were: • 57.1 \pm 22.6 days in the test group • 85.2 \pm 27.4 days in the control group. The difference was statistically significant.

Condition/Study	No.	Design	Test group	Control Group	Results
Obesity (see also Sim	ple obesity in childre	en)			
Richards et al., 1998 (238)	60	, Randomized controlled trial	Auricular acupuncture	Sham acupuncture	 Suppression of appetite was noticed in: 95% of the test group 0% of the control group.
Opium dependence, s	see Dependence, o	pium, cocaine, heroin			• ·
Osteoarthritis					
Junnila, 1982 (55)	16:16	Group comparison (sequential)	Acupuncture	Medication (piroxicam)	 Pain was relieved by: 61% 1 month after a series of acupuncture treatments; no side-effects 32% after 4 months of piroxicam therapy; itching of the skin, intestinal bleeding, or tiredness occurred in 19%.
injection; Facial pain (ii Osteoarthritis; Pain due pseudoradicular pain s	ncluding cranioman e to endoscopic exa yndromes; Renal co	dibular disorders); Gastrointesti	nal spasm; Headache; Kne is obliterans; Periarthritis o	e pain; Labour pain; Low back p f shoulder; Plantar pain due to fa	tralgia, acute; Eye pain due to subconjunctival pain; Neck pain; Neuralgia, post-herpetic; asciitis; Postoperative pain; Radicular and
Pain due to endoscop	100:100		Aquipupatura	Standard medication	Analgania was similar in the two groups but there
Wang et al., 1992 (135) (colonoscopy)	100.100	Group comparison	Acupuncture	(scopolamine butylbromide, pethidine)	Analgesia was similar in the two groups but there were significantly fewer side-effects in the test group.
Wang et al., 1997 (136) (colonoscopy)	30:29	Randomized controlled trial	Electric acupuncture at <i>zúsānlĭ</i> (ST36) and <i>shàngjùxū</i> (ST37)	Pethidine analgesia	Analgesia was similar in the two groups, but there were fewer side-effects in the test group.
Pain in thromboangii	tis obliterans				
Qiu, 1997 (<i>16</i>)	60:30	Group comparison	Body acupuncture (manual)	Medication (intramuscular bucinnazine; also known as bucinperazine)	 Effective rates were: 93.4% in the test group; pain relief started 2– 10 min after needling and lasted for 5.6 h 56.7% in the control group; pain relief started 15–25 min after injection and lasted for 3.1 h.
Periarthritis of should	der				<u> </u>
Kinoshita, 1973 (38)	15:15	Randomized controlled trial	Acupuncture at specific & basic points	Acupuncture at basic points alone	The therapeutic effect was superior in the test group; the difference was significant.
Shao, 1994 (<i>39</i>)	62:62	Randomized controlled trial	Acupuncture at <i>èrjiān</i> (LI2)	Acupuncture at traditional points	 Cure rates were: 66.1% in the test group after 2.2 treatments 31.7% in control groups after 8.2 treatments.

Condition/Study	No.	Design	Test group	Control Group	Results
Pertussis, see Whoopin	ng cough (pertussis)				
Plantar pain due to fas	sciitis				
Karen et al., 1991 (41)	15 per group	Randomized controlled trial	Acupuncture	Sham acupuncture or conventional sports therapy	True acupuncture produced greater improvement in pain records than conventional sports therapy at the end of the treatment period (4 weeks) and at the end of the follow-up period (3 weeks). There was also a statistically significant difference between true and sham acupuncture.
Polycystic ovary synd	-				
Ma et al., 1996 (245)	50:48	Randomized controlled trial	Manual acupuncture plus electric acupuncture plus moxibustion	Conventional Western medication (clomifene)	 Clinical cure (assessment of clinical symptoms, ultrasonic examination and radioimmunoassay of sex hormones) was observed in: 94% of the test group 62.5% of the control group.
Postextubation in child					
Lee et al., 1998 (<i>15</i>)	38:38	Randomized controlled trial	Acupuncture (blood- letting at <i>shàoshāng</i> (LU11) at the end of operation)	No acupuncture	 If laryngospasm developed, patients were immediately given acupuncture at <i>shàoshāng</i> (LU11) or <i>zhōngfǔ</i> (LU1). The laryngospasm was relieved within 1 min in all patients. The incidence of laryngospasm occurring after tracheal extubation in children was: 5.3% in the test group 23.7% in the control group.
Postoperative sympto					
Ding et al., 1997 (252)	50:50	Randomized controlled trial	Conventional Western medication plus acupuncture	Conventional Western medication (no further details available)	 Clinical cure in was observed in: 13 in the test group; marked improvement in 30; cure and improvement rate, 86% 7 in the control group; marked improvement in 21; cure and improvement rate, 56%.
Postoperative convale					
Xu, 1998 (<i>101</i>) (hemiplegia after meningioma removal)	15:15	Group comparison	Body acupuncture	Routine medical treatment (intravenous piracetam)	 Improvement of muscular strength and activities after 10 days of treatment was observed in: 14 in the test group 8 in the control group.
Postoperative pain Christensen et al., 1989 (72) (after lower abdominal surgery)	10:10	Randomized controlled trial	Electric acupuncture	No treatment	The pethidine requirements of each patient were recorded. The quantity of pethidine consumed by the test group was half that consumed by the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Wang et al., 1990 (76) (after tonsillectomy)	33:33	Group comparison	Acupuncture	Medication (penicillin plus Dobell gargle)	Alleviation of pain, reduction in salivation and speed of wound healing were superior in the test group.
Lü et al., 1993 (74) (after anal surgery)	62:30	Randomized controlled trial	Acupuncture	Bucinnazine	 A marked analgesic effect was obtained in: 77% of the test group 27% of the control group.
Tsibuliak et al., 1995 (75) (various)	229:91: 229	Group comparison	Acupuncture	Electric stimulation or narcotic analgesics (omnopon (a Chinese opium alkaloid), trimeperidine)	Although less effective than narcotic analgesics, acupuncture provided adequate analgesia in 50% of patients, & noticeably alleviated severity of postoperative complications (nausea, vomiting, retention of urine, intestinal paresis, impaired drainage function of bronchi).
Felhendler et al., 1996 (278) (after knee arthroscopy)	40	Randomized controlled trial	Acupressure (firm pressure across classical acupoints)	Placebo (light pressure in the same area)	60 min and 24 h after treatment, pain scores on a visual analogue scale were lower in the test group.
Chen et al., 1998 (71) (after abdominal hysterectomy or myomectomy)	25 per group	Randomized controlled trial	TENS at <i>zúsānlĭ</i> (ST36) or dermatomal TENS at the level of the surgical incision	Nonacupoint TENS or sham TENS (no electric current)	Peri-incisional dermatomal TENS and TENS at zusanli were equally effective in decreasing postoperative opioid analgesic requirement and in reducing opioid-related side effects. Both of these treatments were more effective than the nonacupoint or sham TENS.
Premenstrual syndrom					
Li et al., 1992 (155)	108:108	Randomized group comparison	Acupuncture	Herbal medication	 Total relief of symptoms with no recurrence in 6 months of follow-up was observed in: 91.7% of the test group 63% of the control group.
Prostatitis, chronic Luo et al., 1994 (<i>149</i>)	100:81	Randomized controlled trial	Acupuncture at <i>zhìbiān</i> (BL54) and <i>sānyīnjiāo</i> (SP6)	Medication (oral sulfamethoxazole)	Relief of symptoms and improvement in sexual function were superior in the test group.
Pruritus, experimental					
Lunderberg et al., 1987 (226)	10	Randomized crossover trial	Manual or electric acupuncture	Placebo acupuncture (superficial insertion of needle with no specific sensation)	Acupuncture and electric acupuncture reduced subjective itch intensity more effectively than placebo acupuncture. The difference was significant. The results suggest that the two test procedures could be tried in clinical conditions associated with pruritus.

Condition/Study	No.	Design	Test group	Control Group	Results
Pulmonary heart disea	ise, chronic				
Zou et al., 1998 (279)	30:29	Randomized controlled trial	Ginger moxibustion plus acupoint injection	Routine Western treatment (oxygen inhalation, antibiotics and bronchodilators)	 After 1.5–2 months of treatment, improvement was observed in: 27/30 (90%) of the test group; in 1-year follow-up, acute respiratory infection occurred in 7 12/29 (41.4%) of the control group; in 1-year follow-up, acute respiratory infection occurred in 26.
Radicular and pseudo					
Kreczi et al., 1986 (57)	21	Randomized single- blind crossover trial	Laser acupuncture	Mock laser acupuncture	Laser acupuncture was more effective than placebo in 20 out of 21 patients.
Raynaud syndrome, p	rimary				
Appiah et al., 1997 (<i>244</i>)	17:16	Randomized controlled trial	Acupuncture	No treatment	Mean duration of the capillary flowstop reaction induced by local cooling test decreased from 71 s to 24 s (week 1 compared to week 12, $P = 0.001$) in test group. Changes in control group weren't significant. Authors concluded that Chinese acupuncture is a reasonable alternative in treating patients with primary Raynaud syndrome. There was a significant decrease in the frequency of attacks by: 63% in the test group and 27% in the control group.
Recurrent lower urinar	ry-tract infection				
Aune et al., 1998 (<i>152</i>)	67	Randomized controlled trial	Acupuncture	Sham acupuncture or no treatment	 Proportions remaining free of lower urinary-tract infection during6-month observation period were: 85% in the acupuncture group 58% in the sham acupuncture group 36% in the untreated group.
Reflex sympathetic dy	strophy				
Kho, 1995 (280)	28	Double-blind placebo- controlled trial	Acupuncture	Sham acupuncture	Acupuncture was beneficial.
Renal colic					
Lee et al., 1992 (65)	22:16	Randomized controlled trial	Acupuncture	Medication (injection of a metamizole–camylofin combination)	 Both groups experienced a significant decrease in pain levels, with the acupuncture group improving slightly more. Side-effects occurred in: 0/22 in the test group 7/16 in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Zhang et al., 1992 (7)	126:118	Group comparison	Acupuncture	Medication (injection of atropine plus pethidine)	 An analgesic effect was observed in: 99.2% of the test group 71.2% of the control group.
Li et al., 1993 (66)	25:27	Randomized controlled trial	Acupuncture	Medication (injection of atropine plus promethazine and bucinnazine)	 Relief of pain was observed in: all patients in the test group in 25 min on average 90% of the patients in the control group in 50 min.
Retention of urine, trat	umatic				
Pan et al., 1996 (146)	76:32	Randomized controlled trial	Acupuncture	Medication (intramuscular neostigmine bromide)	The therapeutic effect of acupuncture was markedly superior to that of neostigmine injection.
Retinopathy, central se					
Yu et al., 1997 (<i>281</i>)	83:135	Group comparison	Acupuncture (manual)	Medication (rutoside, vitamin C, troxerutin)	 Cure rates were: 46/86 (49.5%) eyes in test group; average duration of treatment required, 50.6 days 52/146 (35.6%) eyes in control group; average duration of treatment required, 63.6 days.
Rheumatoid arthritis	10.10				
Man et al., 1974 (<i>4</i>)	10:10	Group comparison	Electric acupuncture	Sham acupuncture	 Pain relief was observed in: 90% of the treatment group 10% of the control group.
Ruchkin et al., 1987 (5)	10:6	Double-blind controlled trial	Auricular electric- acupuncture	Sham electric acupuncture (no electrical stimulation)	Subjective improvement was observed in:all patients in the test group1 patient in the control group.
Sun et al., 1992 (6)	378:56	Group comparison	Warming acupuncture	Acupuncture	 Marked improvement was observed in: 65.5% of the test group 26.8% of the control group.
Schizophrenia					
Jia et al., 1986 (<i>195</i>)	24:13	Controlled trial	Laser acupuncture	Medication (chlorpromazine)	 After 6 weeks of treatment, marked improvement was observed in: 78% of the test group 39% of the control group.
Zhang et al., 1994 (282)	38:31	Randomized controlled trial	Electric acupuncture plus conventional medication (various)	Conventional medication (various)	The therapeutic effect was significantly greater in the test group.

Condition/Study	No.	Design	Test group	Control Group	Results
Sciatica Kinoshita, 1971 (<i>50</i>)	15:15	Randomized controlled trial	Acupuncture with deep insertion of needles (10–30 mm)	Acupuncture with superficial puncture (5 mm)	The therapeutic effect was greater in the test group. The difference was statistically significant.
Kinoshita, 1981 (<i>51</i>)	15:15	Randomized controlled trial	Acupuncture at <i>dàchángshū</i> (BL25) with deep puncture (6 cm)	Acupuncture with superficial puncture (2 cm)	The therapeutic effect on tenderness, Lasegue's sign, and subjective symptoms was greater in the test group. The difference was significant.
Shen, 1987 (53)	50:50	Group comparison	Long-needle acupuncture	Classical acupuncture	 Effective rates were: 96% of the test group 72% of the control group.
Li, 1991 (52)	100:70	Group comparison	Acupuncture at <i>xiazhibian</i>	Acupuncture at <i>zhibiān</i> (BL54)	 Effective rates were: 98% of test group after 15.8 treatments, on average 81.4% of the control group after 27.7 treatments.
		lation; Male sexual dysfunction,	non-organic		
Sialorrhoea, antipsycl Xiong et al., 1993 (242)	60:60	Randomized controlled trial	Acupuncture	Anisodamine	 After 10 days of treatment, marked reduction in salivation was achieved in: 96.7% of the test group 35.9% of the control group.
Simple obesity in child Yu et al., 1998 (283)	dren 101:101: 50	Randomized controlled trial	Photo-acupuncture or auricular acupressure	No treatment	The effects of photo-acupuncture and auricular acupressure were satisfactory, with better results for the former. After 3 months of acupuncture treatment, the obesity indices decreased significantly and levels of blood lipids, glucose, hydrocortisone and triiodothyronine were all markedly improved.
Sjögren syndrome List et al., 1998 (<i>243</i>)	21	Randomized controlled trial	Acupuncture	No treatment	A significant increase in paraffin-stimulated saliva secretion was found in both groups. There were no statistically significant differences in unstimulated salivary secretion between groups. The study showed that acupuncture is of limited value for patients with primary Sjögren syndrome.

Condition/Study	No.	Design	Test group	Control Group	Results
Small airway obstruction Chen et al., 1997 (284)	on 21:21:21	Randomized controlled trial	Body acupuncture (40 min)	Body acupuncture (20 min and 60 min)	Small airway function in bronchial asthma and chronic bronchitis improved in all three groups. The best result was obtained in the test group.
Smoking, see Depende					C
Sore throat (see also To Gunsberger, 1973 (<i>118</i>)	100 per group	Group comparison	Acupuncture at a single point or at 2 points	No treatment (acupuncture refusers) or petroleum jelly placebo	Results in the two treatment groups were significantly better than in the two control groups. At 48 h, 90% of those receiving acupuncture at 2 points were still reporting pain relief compared with only 30% of those receiving no treatment.
Spine pain, acute (see Santiesteban, 1984 (285)	also Low back pain; 5:5	Sciatica) Randomized controlled trial	Electric acupuncture	Selected physical therapy	The test group showed significant increases in range of motion, straight leg raising, & decreased pain immediately after treatment. Control group showed no improvement.
Sprain Jiao, 1991 (68) (limb)	200:100	Randomized controlled trial	Acupuncture	Physiotherapy	 Pain was relieved after 1 session of treatment in: 32% of the test group (in 84% after 9 sessions) 0% of the control group (in 18% after 9 sessions).
Jin, 1991 (69) (lumbar)	346:50	Group comparison	Hand acupuncture	Medication (analgesic)	 Pain was relieved and function restored in: 1–3 days (average 1.06 days) in test group 3–10 days (average 4.38 days) in control group.
Zheng, 1997 (<i>70</i>) (lumbar)	100:50	Randomized group comparison	Hand acupuncture	Body acupuncture	 Cure (disappearance of symptoms, free movement of the lower back, and no recurrence in 3 years) immediately after 1 session of treatment in: 82.4% of the test group 52.9% of the control group.
Stiff neck Wu, 1997 (<i>286</i>)	100:32	Group comparison	Acupuncture at laozhen	Medication (ibuprofen 0.3 g, 3 times per day)	 Cure was observed in: 80/100 (80%) in the test group after the first session, 10 after the second, and 4 after the third; 6 did not respond in 3 days 12/32 (38%) in the control group on the first day, 6 on the second, and 2 on the third; 12 did not respond in 3 days.

Condition/Study	No.	Design	Test group	Control Group	Results
Stroke Chen et al., 1990 (<i>89</i>) (ischaemic))	20 per group	Randomized controlled trial	Acupuncture	Medication (mannitol, dextrose, citicoline)	A better therapeutic effect (as assessed by EEG- map and somatosensory-evoked potential) was observed in the test group.
Zou et al., 1990 (287) (ischaemic)	32:31	Randomized controlled trial	Acupuncture	Medication (vinpocetine)	A better therapeutic effect was observed in the test group.
Bai et al., 1993 (88) (ischaemic)	40 per group	Randomized controlled trial	Acupuncture	Medication Beniol (a Chinese medicine containing linoleic acid, inositol & other vitamins), troxerutin, nimodipine)	A better neurological outcome was observed in the test group.
Hu et al., 1993 (94) (ischaemic)	30:30	Randomized controlled trial	Physiotherapy plus acupuncture	Physiotherapy	A better neurological outcome was observed for physiotherapy plus acupuncture than for physiotherapy alone.
Jin et al., 1993 (99) (hemiplegia after stroke)	108:100	Randomized group comparison	Temporal acupuncture	Traditional body acupuncture	Significantly better results were obtained in the test group.
Liang, 1993 (<i>100</i>) (sequelae of stroke)	50:50	Randomized controlled trial	Temporal acupuncture	Traditional body acupuncture	Significantly better results were obtained in the test group.
Johansson et al., 1993 (95) (sequelae of stroke)	38:40	Randomized controlled trial	Acupuncture plus physiotherapy and occupational therapy	Physiotherapy and occupational therapy	A more rapid and more complete recovery was observed in the test group.
Zhang et al.,1994 (102) (stroke with aphasia)	22:22	Randomized controlled trial	Scalp electric acupuncture	No treatment	A more rapid and more complete recovery observed in the test group.
Liao, 1997 (<i>91</i>) (hemiplegia after stroke)	108:107	Group comparison	Acupuncture at <i>shŏusānlĭ</i> (LI10) and <i>fútù</i> (ST32)	Routine medication plus hyperbaric oxygenation	 Marked improvement after 20 days of treatment was observed in: 66.7% of the test group 29.0% of the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Jiang et al., 1997 (90) (spontaneous limb pain after stroke)	30:30	Randomized controlled trial	Electric acupuncture	Conventional Western medication (carbamazepine)	 After 30 days of treatment, the two groups showed similar amelioration of pain. Effective rates were: 90% in the test group 86.7% in the control group.
Liu et al., 1997 (92) (myodynamia after stroke)	78:56:30	Group comparison	Scalp or body acupuncture	Medication	 Functional recovery was observed in: 75.6% of the scalp acupuncture group; total effective rate 98.7% 51.8% of the body acupuncture group; total effective rate 92.8% 16.7% control group; total effective rate 80%
Kjendahl et al., 1997 (97) (subacute stroke)	21:20	Randomized controlled trial	Rehabilitation programme plus acupuncture	Rehabilitation programme	The test group improved significantly more than the control group during the treatment period of 6 weeks, and even more during the following year, according to motor-assessment scale, ADL, Nottingham health profile and social situation.
Gosman-Hedstrom et al., 1998 (96) (acute stroke)	104	Randomized controlled trial	Conventional rehabilitation plus deep acupuncture	Conventional rehabilitation plus superficial acupuncture or conventional rehabilitation alone	There were no differences between the groups in respect of changes in the neurological score and the Barthel and Sunnaas activities of daily living index scores after 3 and 12 months.
Si et al., 1998 (93) (acute ischaemic stroke)	42	Randomized controlled trial	Electric acupuncture plus medication	Medication	Clinical functional recovery was significantly better in the test group.
Wong et al., 1999 (98) (hemiplegia after stroke)	59:59	Randomized controlled trial	Electric acupuncture plus rehabilitation	Rehabilitation	Patients in the test group had a shorter hospital stay for rehabilitation and better neurological and functional outcomes than those in the control group, with a significant difference in scores for self-care and locomotion.
Temporomandibular jo Raustia et al., 1986 (288)	int dysfunction (see 25:25	also Facial pain, including c Randomized controlled trial	raniomandibular disorders Acupuncture) Standard stomatognathic treatment	Both treatments resulted in a significant reductior in symptoms and signs. Acupuncture seems to b useful as a complementary treatment, especially in cases with evidence of physiological or neuromuscular disturbances.

Condition/Study	No.	Design	Test group	Control Group	Results
Tennis elbow Brattberg, 1983 (<i>42</i>)	34:26	Group comparison	Acupuncture	Steroid injection	 Improvement was observed at follow-up in: 61.8% of the test group 30.8% of the control group.
Haker et al., 1990 (43)	44:38	Randomized group comparison	Classical acupuncture	Superficial acupuncture	Short-term improvement was significantly greater in the test group.
Molsberger et al., 1994 (<i>44</i>)	24:24	Placebo-controlled, single-blind trial with independent evaluation	Acupuncture	Placebo (acupuncture. avoiding penetration of the skin)	 Pain relief of at least 50% after 1 treatment was reported by: 19 of the test group; average duration of analgesia after 1 treatment, 20.2 h 6 of the control group; average duration of analgesia after 1 treatment, 1.4 h.
Tietze syndrome Yang, 1997 (246)	108:64	Group comparison	Acupuncture (manual) plus cupping	Routine medication (oral indometacin and local injection of prednisolone or procaine) plus physiotherapy	 After 3 weeks of treatment, cure was observed in: 70/108 (64.8%) in the test group 24/64 (37.5%) in the control group.
Tinnitus Jin et al., 1998 (220) (subjective)	35:35	Randomized controlled trial	Body acupuncture	Routine medication, including anisodamine	 After 6 weeks of treatment cure was observed in: 8 (22.9%) in the test group; 10 (28.6%) markedly improved 2 (5.7%) in the control group; 6 (17.1%) markedly improved.
Vilholm et al., 1998 (221) (severe)	54	Randomized controlled crossover trial	Body acupuncture	Placebo	There was no statistically significant difference between the two groups.
Tonsillitis, acute Chen, 1987 (117)	220:50	Group comparison	Acupuncture	Antibiotics (penicillin, etc.)	Earlier relief of fever and sore throat was observed in the test group.
Tourette syndrome Tian et al., 1996 (217)	68:17	Randomized controlled trial	Body acupuncture plus auricular acupressure	Conventional Western medication (haloperidol)	 Cure was observed in: 30.9% of the test group; effective rate at 6-month follow-up, 46/57 (89.7%) 11.8% of the control group; effective rate at 6-month follow-up, 5/13 (69.7%) in the control group.

Condition/Study	No.	Design	Test group	Control Group	Results
Jin, 1998 (<i>216</i>)	30:30	Randomized controlled trial	Body acupuncture plus auricular acupressure	Conventional Western medication (haloperidol)	 After 1 month of treatment, clinical cure with no recurrence at 6-month follow-up in: 30.0% of test group; overall effective rate 93.4% 6.7% of control group; overall effective rate 76.7%.
Ulcerative colitis, chro	onic				
Wu et al., 1995 (<i>134</i>)	24:11	Group comparison	Moxibustion with herbal partition	Sulfasalazine	 After 3 months of treatment, clinical cure was observed in: 13/24 (54%) in test group; improvement in 10 3/11 (27%) in the control group; improvement in 4. The difference was significant.
Ma et al., 1997 (289)	60:30	Randomized controlled trial	Body acupuncture plus moxibustion.	Sulfasalazine plus metronidazole	 After 30 days of treatment, cure (assessed both clinically and endoscopically) was observed in: 76.7% of the test group 56.7% of the control group.
	s , see Female uret	hral syndrome; Neuropathic blac	dder in spinal cord injury; F	Recurrent lower urinary tract infec	tion; Renal colic; Urolithiasis
Urolithiasis Zhang et al., 1992 (7)	126:118	Group comparison	Acupuncture	Fluid infusion plus herbal medication)	 Cure (elimination of symptoms and signs and no residual stones revealed by X-ray or ultrasound examination) was observed in: 90.48% of the test group 33.05% of the control group.
Vascular dementia Lai, 1997 (<i>290</i>)	30:30	Randomized controlled trial	Manual plus electric acupuncture	Aniracetam	 Improvement after 6 weeks of treatment was observed in: 26 (86.7%) of the test group 19 (63.3%) of the control group.
Liu et al., 1998 (291)	60:60: 30:30	Randomized controlled trial	(1) Scalp electric acupuncture	 (2) Nimodipine, (3) Electric acupuncture plus medication (nimodipine), or (4) No treatment 	Assessment by various neuropsychological scales showed that effects of test & control procedures were comparable. After 8 weeks of treatment, assessment (of memory, intelligence and ability to take care of oneself) showed improvement in: 68.3% of group (1) 71.6% of group (2) 73.3% of group (3) 23.3% of group (4).

Condition/Study	No.	Design	Test group	Control Group	Results
Jiang et al., 1998 (292)	33:33	Randomized controlled trial	Electric acupuncture	Dihydroergotoxine	Results were superior in the test group, as assessed by the Hasegawa dementia scale and functional activities questionnaire, increase in superoxide dismutase and decreases in lipid peroxide and nitric oxide.
Viral encephalitis in ch	ildren, late stag	e			
Wang, 1998 (293)	72:42	Group comparison	Scalp electric and manual acupuncture plus routine medication as for control group	Routine medication (including antiviral and anti-inflammatory agents, and nutrients for brain tissue)	 Effective rates were: 59/72 (81.9%) in the test group 19/42 (45.2%) in the control group.
Whooping cough (pert	ussis)				
Yao et al., 1996 (87)	145:50	Randomized controlled trial	Acupuncture at <i>bāxié</i> (EX-UE9)	Chloramphenicol intravenous drip	 After 7 days of treatment, cure was observed in: 98.6% of the test group 10% of the control group.
